P:

INTRODUCTION

The survey series

This report describes the design, administration and data format of the 1993 British Social Attitudes (BSA) survey. This is the ninth in a series started by SCPR in 1983 and core-funded by the Sainsbury Family Charitable Trusts. The series is designed to chart continuity and change across a wide range of social attitudes - for instance, towards politics, the economy, the workplace, education, health and the environment. It is similar to, and indeed was inspired by, the General Social Survey carried out since 1972 by the National Opinion Research Center (NORC) in the United States. The data derive from annual cross-sectional surveys of representative samples of adults aged 18 or over living in private households in Britain. In 1993, half the interviews were carried out by interviewers using laptop computers, rather than the traditional paper-and-pencil method, to test the applicability of Computer-Assisted Personal Interviewing (CAPI) to BSA (see Section 4.2 below). In 1993, the fourth in a series of Northern Ireland Social Attitudes (NISA) surveys was carried out solely by CAPI (see Part II below). This report also includes technical details of the fourth NISA survey.

Surveys in the *British Social Attitudes* series have been carried out annually between 1983 and 1993, except in 1988 and 1992. In these two years, with the agreement of the core-funders, the BSA survey budgets were deployed towards conducting the 1987 and 1992 post-election studies of political attitudes. These were the most recent in the *British General Election Study* (*BGES*) series and, like the 1983 post-election study, were the responsibility of SCPR and Nuffield College, Oxford. (The results of the 1987 and 1991 post-election surveys were published in 1991 and 1994 respectively.¹)

British Social Attitudes has been designed to be fielded as a series of surveys, to allow the monitoring and understanding of *trends* in attitudes, and to examine the *relative* rates at which different sorts of attitude change. Not all questions or groups of questions (modules) are included in each fieldwork round. The modules repeated every year tend to be on subjects where fairly rapid change in attitude might be expected, and for which an annual trend line is therefore likely to be helpful. Variables such as demographic characteristics or party identification, which are needed for interpreting other answers, are also included each time. In any event, constraints of space (we confine ourselves to an average of an hour-long interview each year), the need for economy and our wish to introduce new modules into the questionnaire, all combine to limit the frequency with which each group of questions can be carried. All questions are, however, scheduled for repetition - some each year, some at regular intervals and others less frequently.

Inevitably perhaps, a few questions do not seem to work very well, despite contrary indications at the pilot stage. Many survey series face this difficulty, and its resolution is by no means straightforward. To change or remove unsatisfactory questions would sacrifice comparability over time; to retain them would run the risk of producing and reproducing

Heath A., Jowell R., Curtice J., Evans G., Field J. and Witherspoon S. (1991), Understanding Political Change: Voting Behaviour in Britain 1964-1987. Oxford: Pergamon.
 Heath A., Jowell R., Curtice J. and Taylor B. (1994), Labour's Last Chance? The 1992 Election and Beyond. Aldershot: Dartmouth.

misleading information Neither practice is desirable but one or the other is unavoidable And, of course, the vocabulary changes over the years and our questions have inevitably to change to reflect this The main changes in question wording, filter and interviewer instructions and so on made between 1984 and 1989 are noted in the *Cumulative Sourcebook* (see below) Changes made in 1990 and 1991 are noted in the documentation accompanying the Combined Dataset (details of which follow)

Until 1991, standardised SPSS-x set-up files have been created for all the existing datasets. and deposited at the Economic and Social Research Council (ESRC) Data Archive at the University of Essex This enables anyone in the academic community to do analytic or interpretative work of their own, or to use the datasets for teaching purposes The Archive will provide details about on-line access The survey data may be of interest substantively (either as sets of cross-sectional samples or as a series recording change over time), or methodologically (for instance, comparing different ways of asking questions, or the development of scale items) This year, due to technical differences in data-collection methods, instead of full datasets, SPSS-x export-files will be deposited at the Data Archive The export-files will be backed up by the SPSS-x programming files allowing anyone who wishes to read the data into a different programme to follow the necessary programming steps Further information about the accessibility of the full dataset can be provided by BSA researchers at SCPR This volume is intended to serve as the technical documentation for the British and Northern Ireland 1993 data, to allow users to find and interpret the information they need

On-line access is also available through the Data Library at the University of Edinburgh Peter Burnhill or Donald Morse at the Centre for Applications, Software and Technology (CAST), University of Edinburgh, will provide details

Developments and offshoots

Users may like to take note of other developments in the British Social Attitudes series, some of which might affect the analyses they intend to carry out

1 The Northern Ireland Social Attitudes (NISA) survey began in 1989 and the 1993 survey is the fourth in the series Between 1989 and 1991 it was funded by the Nuffield Foundation and the Central Community Relations Unit in Belfast, and since 1993 by all the government departments in Northern Ireland Around 900 people have been interviewed there each spring by the Policy Planning and Research Unit (PPRU), using a questionnaire which contains all of the 'core' questions asked each year on BSA, and several of the special modules in that year In addition, it contains a module dealing with issues of particular concern to the province (for example, community relations and attitudes towards the security forces), some of these questions are also asked in Britain. The annual datasets are, of course, independent and cannot simply be added together to provide UK data But they do allow data-users to make comparisons on a range of issues between the attitudes of UK citizens on either side of the Irish Sea² Technical details of the fourth NISA survey are given in **Part II** of this report. These datasets are also made available *via* the ESRC Data Archive

² Some of the findings are reported in *The 7th, 8th and 9th British Social Attitudes Reports* More comprehensive results are given in Stringer and Robinson (1991, 1992 and 1993), and for the 1993 survey in Breen, Devine and Robinson (1995, forthcoming)

2. In November 1991, the first British Social Attitudes Cumulative Sourcebook (partfunded by Shell UK Ltd.) was published.³ The Sourcebook brings together responses to all the questions asked in the series between 1983 and 1989 (with all variations noted), together with year-by-year distributions of answers (numbers and percentages), and each variable's SPSS-x name. Fully cross-referenced and with three indexes, the Sourcebook is intended both as a companion volume to the series of annual Reports (also published until 1990 by Gower⁴), and as a comprehensive codebook for users of the dataset. A second edition of the Sourcebook, incorporating responses to questions asked between 1990 and 1994, is in preparation but not yet scheduled for publication.

3. Thanks to funding from the ESRC (under Grant No. R 00023 3230) the Sourcebook has now been complemented by a 'Combined Dataset', also deposited at the Data Archive. This provides in one computer file the data for all eight BSA surveys carried out between 1983 and 1991. A parallel dataset for Northern Ireland, containing data from the 1989, 1990 and 1991 NISA surveys, has also been prepared. The two combined datasets, together with full documentation, are intended to benefit academic researchers and others who wish to carry out secondary analysis or to use them as teaching resources. In addition, the Data Archive has produced a CD-Rom disk containing the seven individual (not combined) BSA datasets from 1983 to 1990. The BSA 'Combined Dataset' will be updated in 1995 to include data up to 1994.⁵

4. Since 1985, a module of questions included in each year's *British Social Attitudes* survey has allowed users of the British datasets to make cross-national comparisons. This initiative began in 1984 when the Nuffield Foundation funded SCPR to convene a series of meetings with research organisations abroad which were also carrying out regular national surveys of social attitudes. From these meetings, a group called the *International Social Survey Programme (ISSP)* has evolved. Each member undertakes to field annually an agreed module of questions which conform to ISSP working principles. Each module is designed for repetition at intervals, to allow comparisons both between countries and over time. The following 22 institutions comprise the current (1993/94) membership:

| Research School of Social Sciences | Institute of Sociology |
|--|--|
| Australian National University | Czechoslovak Academy of Sciences |

Centre for Sociological Investigations Sociological, Economical and Political Analysis Madrid, Spain

Department of Sociology University of Umeå, Sweden

National Opinion Research Center (NORC) Chicago, USA

Since 1989, the ISSP modules have also been fielded in Northern Ireland, on the Northern Ireland Social Attitudes survey

The ZentralArchiv at the University of Koln acts as archivist to the ISSP and has produced combined datasets for each of the first seven modules fielded between 1985 and 1991, and accompanying codebooks Modules fielded or planned are

| 1985 | Role of government - 1 |
|---------------|---|
| 1986 | Family networks and support systems |
| 1 987 | Social inequality |
| 1988 | Family and changing gender roles - 1 |
| 1 989 | Work orientations - 1 |
| 1 99 0 | Role of government - 2 (part-replication) |
| 1991 | Religion |
| 1992 | Social inequality - 2 (part-replication) |
| 1993 | Environment |
| 1994 | Family and changing gender roles - 2 (part-replication) |
| 1995 | National identity |
| 1996 | Role of government - 3 (part-replication) |
| 1997 | Work orientations - 2 (part-replication) |

In 1993, the environment module was carried on the B version of the BSA self-completion questionnaire (Qs 201 to 223) and on Qs 201 to 223 of the NISA self-completion questionnaire

International Social Attitudes, the 10th BSA Report (published in 1993), and the sixth report in the annual series, British Social Attitudes: special international report, (published in 1989) present and comment on some of the data collected between 1985 and 1992.

Contact names and addresses for each of the current ISSP member countries are given in Appendix J.

5. In a further cross-national venture, SCPR joined with social research institutes in four other EU countries (Germany, the Irish Republic, Italy and the Netherlands) in a consortium to extend the 1993 ISSP questionnaire module on environmental issues. This consortium (COMPASS) has been funded by the European Union. The COMPASS questions are on the **B** version of the self-completion questionnaire (Qs. 2.24 to 2.50).

6. In 1989, SCPR and Nuffield College, Oxford set up the Joint Unit for the Study of Social Trends (JUSST) which was awarded the status of an ESRC Research Centre in 1992. In 1994, the Centre received funding for a further five years upon which it changed its name to CREST (Centre for Research into Elections and Social Trends). Under its new name, the Centre has launched a new panel study to investigate how, when and why people's attitudes, perceptions, political allegiances and voting behaviour change between general elections. Respondents who were first interviewed as part of the SCPR/Nuffield College 1992 postelection cross-sectional study will be followed up at regular intervals (sometimes by face-toface interviews, sometimes by telephone) until just after the next general election, when they will be replaced by a new panel. These surveys will feed off the BSA surveys and vice versa, providing a rich source of data about changing social and political attitudes and behaviour in Britain during the last decade of this century. CREST also carries out methodological research via the BSA and BGES series in order to develop new and better tools for attitude measurement (for instance, see Chapters 7 and 9 of The 11th Report). Results of scaling experiments carried out in 1990 and 1991 are published in CREST Working Paper No. 25 (Evans and Heath, 1994).

7. Between 1984 and 1986 the ESRC funded the introduction of a panel element into the series, enabling us to reinterview respondents to the 1983 questionnaire in the three following years. In this way it was possible to examine *individual* attitude change, not simply aggregate change, and to assess the possible effects of attrition and conditioning in the panel.⁶ The data for all four panel surveys are lodged at the ESRC Data Archive, together with copies of the Technical Report.⁷

Arrangement of the report

Part I of this report describes the 1993 British Social Attitudes survey. The 1993 Northern Ireland Social Attitudes survey is described in **Part II**. Appendices A-J contain full technical details of the surveys and further information for users of the two datasets.

5

⁶ For a discussion on a comparison between the 1983 and 1984 results, see Lievesley, D. and Waterton, J., 'Measuring individual attitude change' in Jowell, R. and Witherspoon, S. (eds), (1985), *British Social Attitudes: the 1985 Report.* Aldershot: Gower, pp. 177-194.

⁷ MacGrath, K. and Waterton, J., (1986), British Social Attitudes: 1983-1986 Panel Survey. Technical Report. London: SCPR.

I BRITISH SOCIAL ATTITUDES

1. THE 1993 SURVEY

1.1 Structure and funding

In common with previous British Social Attitudes surveys, the 1993 survey had two components The main one was a questionnaire administered by interviewers and lasting, on average, a little less than an hour The second was a self-completion supplement for respondents to fill in after the interview The supplement was either collected by the interviewer or posted by the respondent to SCPR's Field Office The questionnaires with the percentage distribution of responses appear in Appendix D of this report

Since 1986 the generosity of the core-funders, the Sainsbury Family Charitable Trusts, has allowed us to interview around 3,000 respondents⁸, a substantial increase from the 1,700 to 1,800 interviewed in the first three years of the *British Social Attitudes* survey series The additional funding has enabled us to field two different versions of both questionnaires Certain 'core' questions (including all the classificatory items) are asked of all respondents, the remainder are asked of (random) halves of the sample ⁹ Full details are given in Section 2.3 below

Each year SCPR is committed to producing a book which serves as a guided tour around some of the main findings The contents pages of the eleven *Reports* published to date are reproduced in **Appendix I** Potential users of the data may wish to look at this appendix to see whether topic areas relating to their field of interest have been covered in any of the *Reports*

The steadfast support of the core-funders has guaranteed the continuation of the survey into However the series needs, and has been fortunate enough to receive, the mid-1990s substantial additional financial support from a variety of sources The Department of Employment has supported the series since 1984, enabling us to include (and report on) employment and labour market questions The Department of the Environment has been a regular supporter of the series since 1985, most recently providing funding for a set of question on attitudes to local government, fielded in 1994 The Countryside Commission has in most years between 1985 and 1993 provided funding for us to include questions designed to monitor 'green' issues since 1990, the ESRC has provided additional funding (under Grant No W103 261 006 and currently No R000 221 282) to support modules on countryside and environmental issues until 1996 The Department of Health, the Home Office and the Department of Social Security have more recently provided financial support to enable us both to continue fielding questions first asked in 1983, and to rejuvenate the series with new ones Since 1991, funding has also come from the Charities Aid Foundation, to support a series of questions on charitable giving

In addition, new government funding from the Department for Education from 1993 onwards will allow us to continue to monitor public attitudes towards schooling and higher education

⁸ From 1994 onward, the number of interviews will be increased to around 3500

⁹ Starting in 1994, the questionnaire will be administered on three, rather than two, versions

The DfE also supplemented funds provided by the Scottish Office to field a further set of questions about education, also asked in a number of other OECD countries (Qs.2.18 to 2.25 on the A version of the BSA self-completion questionnaire). These various continuous sources of funds, have in some years been supplemented by other contributions, such as from the Department of Transport and the Department of Trade and Industry, enabling us to carry questionnaire modules on topics of mutual interest. In each case, the aim is to repeat these measures in a future, but as yet unspecified, round of the series.

The Economic and Social Research Council, which contributed seed-funding for *British Social Attitudes* and funded the panel study, has continued to support the survey series (as noted above). Most recently, a grant (No.L119 251 021 under its Transport and the Environment Programme) helped to fund a set of questions on issues to do with road traffic. The ESRC also, of course, supported the series through its grant - No. Y303 253 001 - to the Joint Unit for the Study of Social Trends (JUSST), now the Centre for Research into Electoral and Social Trends (CREST). The Nuffield Foundation has also provided welcome funding over the years, to help launch the ISSP and to allow us to ask questions on popular perceptions of right and wrong and on civil libertarian issues; and between 1989 and 1991 (as already noted) the Foundation provided a valuable 'independent' element of seed-funding for the *Northern Ireland Social Attitudes* survey series.

1.2 Topic areas covered in the series to date

Each year the interview questionnaire contains a number of 'core questions'. These cover major topic areas such as the economy, labour market participation and the welfare state. The majority of these questions are repeated in most years, if not every year. In addition, a wide range of demographic and other classificatory questions is always included. The remainder of the questionnaire is devoted to a series of questions (modules) on specific issues - such as on AIDS, drugs, and sexual relations - which are intended for repetition at longer intervals. The chart overleaf provides a guide to the topic areas covered in the nine surveys carried out to date.

The annual substantive *Report* to some extent mirrors the content of the previous year's questionnaire (see Appendix I). The *Reports* can, of course, present and interpret only a small fraction of the findings. Nevertheless, they may be a useful starting point for potential users of the data.

2. THE SAMPLE

The survey was designed to yield a representative sample of adults aged 18 or over living in Great Britain.

2.1. Sampling frame

This year the sample for the *British Social Attitudes* survey was drawn from the Postcode Address File (PAF) whereas in previous years it had been drawn from the electoral register (ER). Several factors influenced the decision to switch from ER to PAF. The former is

increasingly regarded as a deficient sampling frame because it is not intended to provide a complete list of residential addresses but rather a list of voters Some groups, for example young people, those from ethnic minorities and residents of inner cities are less likely to vote and thus less likely to be included in the sampling frame, resulting in biased coverage The main advantage of PAF is perceived to be its superior coverage of residential addresses Another distinct advantage of PAF is the ability to computerise sample selection, an increasingly important consideration now that more and more survey processes are becoming computerised (see Section 4.2 for a detailed discussion of Computer-Assisted Personal Interviewing) A perceived disadvantage of using PAF as the sampling frame for this survey is that the BSA collects information about *individuals* and PAF provides very few clues about the likely number of individuals at an address Moreover, a change of sampling frame could have an effect on response rates, on the demographic and socio-economic structure of the respondent 'population, and hence on the distribution of responses to particular questions In the light of the somewhat conflicting status of the two sampling frames for a survey of individuals, it was decided to carry out a split-run experiment on the 1991 survey half the sample was drawn from the ER and the other half drawn from PAF Extensive analyses of the results of the experiment led us to adopt PAF as the preferred sampling frame for BSA The application of a wider range of weights, used to correct for the differential overall selection probabilities of individuals, does not seem to have reduced the sample efficiency ¹⁰

2.2. Sample design

The British Social Attitudes survey is designed to yield a representative sample of adults aged 18 or over For practical reasons, the sample is confined to those living in private households People living in institutions (though not in private households at such institutions) are excluded, as are households whose addresses were not on PAF Postcodes of areas north of the Caledonian Canal were excluded their geographically scattered inhabitants are prohibitively costly to interview Fieldwork was carried out in the spring with some interviewing taking place in early summer

The sampling method involved a multi-stage design, consisting of two stages of selection

First, postal sectors were stratified prior to selection

Any postal sector with less than 500 delivery points (DPs) was grouped with an adjacent sector which together were than treated as one

The list of postal sectors was sorted into 11 standard regions (treating London and the South East as two separate regions)

Within each region, sectors were listed in ascending order of population density

Cut-off points were then drawn at one third and two thirds down the ordered list of DPs so that, within each region, three roughly equal-sized bands were created

Within each of the 33 bands sectors, were listed in order of percentage of owneroccupier households

¹⁰ For a detailed discussion on the advantages and disadvantages of ER and PAF as sampling frames for the survey, see Lynn and Taylor (1994)

Selection of sectors

One hundred and seventy-six sectors were selected systematically with probability proportional to DP count in England, Scotland and Wales.

Selection of addresses

Twenty-eight addresses were selected from each sector. The PAF sample was therefore 176 x 28 = 4928 addresses.

The addresses in each sector were selected by starting from a random point on the list of addresses, and choosing each address at a fixed interval.

Selection of individuals

Interviewers called at each address selected from the PAF, and listed all those eligible for inclusion in the sample - that is, all persons currently aged 18 or over and resident at the selected address.

The interviewer then selected one respondent by a random selection procedure (again using a computer-generated 'Kish-grid'). Where there were two or more households or 'dwelling units' at the selected address, interviewers first had to select one household or dwelling unit using a Kish grid; they then followed the same procedure to select a person for interview.

2.3 Questionnaire versions

Alternate serial numbers were allocated to the A or B half of the sample. Odd serial numbers were allocated to the A sample, and even serial numbers to the B sample, so that each questionnaire version was assigned to 2,464 addresses. This meant that each interviewer (and each sampling point) had both A and B addresses.

3. WEIGHTING

Before analysis, the data were weighted.

The weighting applied reflected the relative selection probabilities of the individual at the three main stages of selection: address; household and individual.

First, because addresses were selected using the Multiple Output Indicator (MOI), weights had to be applied to compensate for the greater probability of an address with an MOI of more than one being selected when compared to an address with an MOI of one. Secondly, because the PAF does not list the number of persons at each address (meaning that the selection probabilities cannot take size of household into account), the data were weighted to take account of the fact that individuals living in large households had a lower chance than individuals in small households of being included in the sample. Thirdly, the PAF does not contain any information about how many households or 'dwelling units' are present at each address; in some cases several dwelling units have the same postal address. To compensate for this, the weighting has to take account of the number of dwelling units at an address, as well as the number of adults in the selected unit

All the weights fell within a range between 0 5 and 15, and in only 24 cases was the weight greater than 4 0, the average weight applied was 1 9

The distribution of weights used is shown below

| Weight | No | % | Scaled weight |
|--------|------|------|---------------|
| 05 | 41 | 14 | 0 28 |
| 1 | 870 | 29 5 | 0 53 |
| 2 | 1610 | 55 0 | 1 06 |
| 3 | 307 | 10 4 | 1 59 |
| 4 | 93 | 3 2 | 2 13 |
| 5 | 16 | 05 | 2 66 |
| 6 | 4 | 01 | 3 18 |
| 8 | 1 | 0 0 | 4 24 |
| 10 | 2 | 0 1 | 5 30 |
| 15 | 1 | 0 0 | 7 95 |

The weighted sample was scaled down to make the number of weighted productive cases exactly equal to the number of unweighted productive cases (n=2945)

Using the weights

The weight for each record has been computed and has been recoded on position 1 of the system file The relevant SPSS-x derived variable is

V1a) Weight [WTFACTOR]

Users must weight the data before analysis

4. DATA COLLECTION AND RESPONSE

4.1 Piloting

Two small-scale pilots to test new questions were carried out in January and February 1993 Respondents were selected by quota sampling methods to include men and women in manual and non-manual jobs across a range of ages In all, 105 interviews were achieved, all by traditional methods (see Section 4.2 below) All interviewers were personally debriefed by the members of the research team

4.2 Computer-Assisted Personal Interviewing (CAPI) experiment

As mentioned earlier, in 1993 the applicability of CAPI to the British Social Attitudes survey was tested.

CAPI has been increasingly used over the past decade as an alternative to traditional (Pencil and Paper Interviewing) techniques (or PAPI). CAPI involves the use of lap-top computers during interview, with interviewers entering responses directly into the computer.¹¹ One of the advantages of CAPI is that it significantly reduces both the amount of time spent on data-processing and the number of coding and editing errors. Over a longer period, there could also be significant cost savings.

A split-sample experiment was carried out, whereby a random half of the sample points (even numbers) was allocated to CAPI and the rest to PAPI (odd numbers). The decision to mount an experiment, rather than to change entirely to CAPI, stemmed from a concern that a different interviewing technique might alter the distribution of responses and so affect the year-on-year consistency of BSA data.

Analysis of the experiment has shown that CAPI is a feasible and efficient mode of data collection for the BSA survey series (Lynn and Purdon, 1994). However, those who analyse and interpret BSA data should be aware, when making comparisons between pre- and post-CAPI survey rounds, that there are response effects. This is particularly the case on scale questions where the proportion of respondents giving neutral answers is lower with CAPI than it is with PAPI. The implication of this is that a change in data collection may artificially alter scale means, or the proportion giving an answer on one particular side of a scale.

Because the magnitude of response effects is unlikely to be large enough to alter the broad messages of the data and because of the improvements that CAPI brings to the survey process, it has been decided that future BSA survey rounds will be administered by CAPI.¹²

4.3 Main stage fieldwork

Interviewing was carried out mainly during April, May and June 1993, with a small number of interviews at 'reissued' addresses taking place later.

Fieldwork was conducted by 176 interviewers drawn from SCPR's regular panel. They all attended a one-day briefing conference to familiarise them with the selection procedures and questionnaires. In addition, interviewers using CAPI attended two training days prior to the briefings. The average interview length was 51 minutes for version A of the questionnaire and 56 minutes for version B.

¹¹ Interviewers were given a two-day CAPI training course before starting their interviews.

¹² For the self-completion questionnaire we will continue to use the traditional pencil-and-paper method.

The total final response achieved is shown below

| | То | tal |
|--------------------------------------|------|-----|
| | No | % |
| Addresses issued | 4928 | |
| Vacant, derelict, other out of scope | 619 | |
| In scope | 4309 | 100 |
| Interview achieved | 2945 | 68 |
| Interview not achieved | 1364 | 32 |
| Refused | 1109 | 26 |
| Not contacted ¹⁴ | 138 | 3 |
| Other non-response | 117 | 3 |

The response rate achieved with the A version of the questionnaire was almost 69 per cent (68 7), while for the B version it was slightly below 68 per cent (67 8) Response rates ranged between 59 per cent in Greater London and 78 per cent in the North of England

More detailed statements of response, by questionnaire version, mode of interview (CAPI or PAPI) and Standard Region, are included in Appendix B.

4.4 Self-completion questionnaire

As in earlier rounds of the series, respondents were asked to fill in a self-completion questionnaire which was, whenever possible, collected by the interviewer Otherwise the respondent was asked to post it to SCPR If necessary, one, two or three postal reminders were sent to obtain the self-completion supplement. The second reminder was accompanied by a further copy of the appropriate version of the questionnaire. In addition, interviewers who had notified the office that they themselves were to collect the self-completion questionnaire were sent letters reminding them to do so. Copies of the reminder letters are included in Appendix H.

Three hundred and seventy-eight respondents (13 per cent of those interviewed) did not return their self-completion questionnaire Version A of the self-completion questionnaire was returned by 88 per cent of respondents to the face-to-face interview, version B by 86 per cent Non-respondents to the self-completion questionnaire included a higher proportion of unskilled manual workers, respondents with no formal educational qualifications and those aged 65 or over However, since the overall proportion returning a self-completion questionnaire was reasonably high, we decided against additional weighting to correct for non-response

¹³ 'Refusals' comprise refusals before selection of an individual at the address, refusals to the office, refusal by the selected person, 'proxy' refusals (on his or her behalf) and broken appointments after which the selected person could not be recontacted

¹⁴ 'Non-contacts' comprise households where no-one was contacted, and those where the selected person could not be contacted (never found at home, known to be away on business, on holiday, in hospital and so on)

Those not returning a self-completion questionnaire were assigned in -1 value at the following positions:

A and B Version : 451 to 482
A version : 483 to 599
B Version : 600 to 756

and are coded '51' at position 766. Records with a self-completion supplement are identified by code '61' at position 766. The derived variable is:

V1b) [SELFCOMP]

4.5 Advance letter

An advance letter was sent to all the selected households in the 1993 *British Social Attitudes* sample. The letter briefly described the purpose of the survey and the coverage of the questionnaire, and asked for co-operation when the interviewer called. Although earlier experiments have shown that the effect of the advance letter on overall response is apparently negligible¹⁵, most interviewers have indicated that it greatly facilitates door-step procedures. The majority of interviewers appreciate them too.

5. DATA PREPARATION AND ANALYSIS

5.1 Data preparation

As paper questionnaires and 'questionnaire disks' were returned from the field to SCPR's data processing office at Brentwood, Essex, they were booked in (that is, checked against the issued sample) and then sent for editing. A coding supervisor was appointed for this stage of the survey and worked closely with the team members and the programmer.

Because the survey involved both PAPI and CAPI (see Section 4.2 above), data editing was carried out using manual and computer methods.¹⁶ The coding team initially went through each questionnaire either manually (for PAPI interviews) or on screen (for CAPI interviews). And at this stage occupation coding was carried out, and listings were prepared (from 200 questionnaires) of verbatim 'other' answers¹⁷ to selected precoded questions. From these listings, code frames were agreed by members of the research team, and were then incorporated into the edit and coding process (see Appendix E).

¹⁵ For a more detailed discussion of the experiments, see Brook, Prior and Taylor (1992, page 17).

¹⁶ Refusals comprise refusals before selection of an individual at th address, refusals to the office, refusal by the selected person, 'proxy' refusals (on his or her behalf) and broken appointments after which the selected person could not be recontated.

¹⁷ In CAPI, interviewers have a special box in which to enter verbatim 'other' answers. For each variable, there is space for up to 100 characters.

Following the first edit stage, the paper-and-pencil questionnaires from the main interview and the self-completion questionnaires were sent for keying which was 100 per cent verified. The paper-and-pencil interview and self-completion questionnaires were then merged with the CAPI questionnaires so that the next editing stage could be done in CADI (Computer-Assisted Data Input) using the Blaise software (the same as that used to generate the CAPI questionnaire)

The second edit included a full set of range and filter checks Error reports generated by the computer edit were of two kinds a summary of errors by type and a listing of individual errors. Some classes of error were resolved by the application of logical rules, the remainder by individual amendments made by reference to the questionnaires. After correction, the records were resubmitted to the edit procedure. The edit process continued until all records 'passed'

In the final edit, computer-generated checks, routing and the accuracy of responses to the main questionnaire and the self-completion questionnaire were verified

In general, code 8 (or 98, 998 or 9998 depending on the range of the column field) was used for 'don't know' responses Prior to 1993 when the BSA survey was carried out completely on paper, 9 (or 99, 999 or 9999) was used to indicate no response No response could mean two things interviewer error or respondent refusal except for some questions (such as political party identification and religious affiliation), where the code frame specifically included a refusal code (usually 7, 97, 997 or 9997) In CAPI, interviewer error is controlled because interviewers must enter a code at each question in order to be able to continue If the respondent refuses to answer a question, however, interviewers can press the refusal key, which in Blaise is coded as a 9 Where the code frame for a specific question already includes a precode for 'refusal', interviewers have the option of either entering that code or pressing the refusal key Because the 1993 survey was carried out using both PAPI and CAPI methods, the code 9 (or 99, 999 or 9999) can still mean that either the respondent refused to answer the question or that the interviewer failed to ring a code

Final listings of 'other' answers to all other questions were compiled, and may be obtained from SCPR if required for a particular purpose Coding frames used for open-ended questions, and 'other answers' and coding instructions for selected precoded questions, may be found in **Appendix E**

5.2 Main analysis variables

The BSA datasets contain a large number of background demographic and other classificatory variables Most of the information was collected about the respondent only, but some (mainly occupational details) were also collected for the respondent's spouse or partner, if he or she was married or living as married. In this section, the main analysis variables, the question number on the paper questionnaire and their SPSS-x variable name are listed, together with guidance as to how they have been grouped for ease of analysis. The exceptions are party political identification which is covered in Section 5.3, occupation covered in Section 5.4, industry covered in Section 5.5 and attitude scales covered in Section 5.6

All the derived variables are listed in Appendix G

Gender and age

Gender and exact age are recorded for the respondent and for all members of his or her household (Q.901a,b) variables [RSEX], [RAGE]; [P2SEX], [P2AGE], etc. Two further variables have been derived for the respondent only:

- V2a) Age within gender 7 age-bands [RSEXAGE]
- V2b) Age 7 age-bands [RAGECAT]

Marital status

As is the case for many variables, a priority coding system operates for marital status, asked at Q.900a (e.g. 'divorced' would have priority over 'widowed'). The variable is called *[MARSTAT]*. A further variable has been derived, combining 'married' and 'living as married':

V3) Marital status (summary) [MARRIED]

Note that 'living as married' refers only to partners of the opposite gender.

Region

The Registrar General's Standard Regions have been used, with Greater London shown, as is customary, separate from the remainder of the South East. The full version, derived from the sampling point number *[SPOINT]*, has been recoded as a derived variable; and there is also a summary version:

- V4a) Standard Region [STREGION]
- V4b) Standard Region (compressed) 6 categories [REGION]

Great care must be taken with regional analysis: the sample in several regions is small and heavily clustered and so could be subject to large sampling errors. For most purposes, it will be advisable to group regions to form broader categories for analysis, or to combine two or more years' data.¹⁸ As noted above, a combined dataset for 1983-91 was deposited at the ESRC Data Archive in autumn 1992.

Education

Respondents are asked for the age when they completed their continuous full-time education. This variable is *[TEA]* (terminal education age), Q.904. They are also asked about examinations passed, and any academic or vocational qualifications obtained, at Qs.905 and

For examples of analyses carried out using combinations of years, see: Curtice, J., 'One nation?' in British Social Attitudes: The 5th Report (1988) (eds. Jowell, R., Witherspoon, S. and Brook, L.), Aldershot: Gower; Blanchflower, D. and Oswald, A., 'Self-employment and the enterprise culture' in British Social Attitudes: The 7th Report (1990) (eds. Jowell, R., Witherspoon, S. and Brook, L. with Taylor, B.), Aldershot: Gower; and Curtice, J. 'The North-South Divide', in British Social Attitudes: The 9th Report (1992) (eds. Jowell, R., Brook, L., Prior, G. and Taylor, B.), Aldershot: Dartmouth.

906 Variable names are [SCHQUAL], [PSCHQUAL], and [EDQUAL1] - [EDQUAL16] There is also a derived variable

V5) Highest educational qualification obtained - 7 categories (excluding N/A, D/K) [HEDQUAL]

We also ask about private schooling at Q 903 whether the respondent has ever attended a private primary or secondary school in the UK *[RPRIVED]*, whether the respondent's spouse or partner has done so *[SPRIVED]*, and whether any of the respondent's children have done so *[CHPRIVED]* Our definition of 'private school' excludes nursery and voluntary-aided schools, and 'opted-out' grant-maintained schools Responses to these three questions have been combined to form a derived variable

V6) Household members' attendance at private schools- 3 categories [PRIVED]

Priority coding operates

Accommodation

There are several variables relating to accommodation In the 'household grid' (Q 901) we ask for each household member whether he or she has legal responsibility for the accommodation [*RRESP*], [*P2RESP*], etc There is also a derived variable

V7a) Whether respondent has sole, shared or no legal responsibility [LEGALRES]

At Q 100a, the interviewer codes and checks type of accommodation [HOMETYPE], and at Q 100b, whether or not the respondent lives on a housing estate [HOMEEST] At Q 101, we ask about tenure type [TENURE1] which appears in summary form as derived variable

V7b) Accommodation tenure (summary) [TENURE2]

collapsed into five categories (plus 'no information')

Religious affiliation and attendance

At Q 102a, respondents were asked which religion, if any, they belonged to [RELIGION], at Q 102b, which religion, if any they were brought up in [FAMRELIG], and at Q 103 how often they attended services or meetings connected with their religion [CHATTEND] In addition, two summary variables are routinely derived

- V8a) Respondent's religion (summary) [RELIGSUM]
- V8b) Religion respondent brought up in (summary) [RLFAMSUM]

each of six categories

Ethnic origin

At Q.104, respondents were shown a card and asked to which of seven ethnic groups they considered they belonged. (The card also allowed respondents to name an 'other' origin.) This variable [*RACEORIG*] is asked on both versions of the questionnaire.

Income

Towards the end of the classification section (Q.915a,c), interviewers showed respondents a card listing 16 income bands, and asked them to read out the letter corresponding to their gross household income [HHINCOME]; and (if they were currently in paid work) their gross earnings [REARN]. The income card used in 1993 is reproduced in Appendix E (it is periodically adjusted to take account of inflation).

On the **B** version of the questionnaire (Q.B87b), we asked also for self-rated income [SRINC] - 'high', 'medium' or 'low'.

Economic position

At the beginning of Section Two of the questionnaire (Labour Market Participation) respondents were shown a card and asked which description applied to what they were doing in the previous seven days - (Q.19, [RECONACT]). A priority coding system operated. The response to this question determined which parts of the rest of the labour market module (e.g. for employees, the self-employed, unemployed people) respondents were asked. The economic position of the respondent's spouse or partner [SECONACT] was coded at Q.910b.

There are also variables incorporating responses to questions on full- or part-time work (Q.22 for respondents [ESRJBTIM]; Q.912j for spouses/partners [SPARTFUL]); and on whether the respondent/spouse was an employee or self-employed (Q.20 for respondents [REMPLOYE]; Q.912f for spouses/partners [SEMPLOYE]). Two further variables have been derived:

V9) Current economic position - 12 categories [RECONPOS] for respondents; [SECONPOS] for spouses/partners.

It should be noted that the conventions used for classifying those in paid work differ from those used in the Census, in that a lower limit to the number of hours worked per week is specified; the classification used in the *British Social Attitudes* surveys is based on those working 10 or more hours in the seven days preceding the interview. This especially affects the classification of women's economic positions.

Other background variables

These include:

- Daily morning newspaper readership Q.1 [READPAP], [WHPAPER]
- Membership of private health insurance scheme (and who pays) Qs.10a) and b) [PRIVMED], [PRIVPAID]
- Trade union or staff association membership Q.909a) and b), current membership [UNIONSA]. and, for non-members, past membership [UNIONEVR].

- Regular access to a car or van Q 913 [CAROWN]
- Current receipt (by respondent and/or partner) of means-tested state benefits Q 914a,b [ANYBNEW], [BENFTN1] [BENFTN12] Note that these replace the questions asked up until 1991 which referred to benefits received within the previous five years
- Share ownership Q 916 [OWNSHARE]

5.3 Party political identification

Respondents were classified as identified with a particular political party on one of three counts if they considered themselves supporters of the party (Q 2a,d), or as closer to it than to others (Q 2b,d), or as more likely to support it in the event of a general election - Q 2c These three groups are described respectively as *partisans*, *sympathisers and residual identifiers* The derived variable is

V10a) Party political identification [PTYALLEG]

The three groups combined are referred to as identifiers [PARTYID1] There is also a derived variable

V10b) Party political identification (compressed) [PARTYID2]

Respondents who indicated no party preference were classified as non-aligned

5.4 Occupation

Until 1990, the occupation coding scheme used for all *British Social Attitudes* surveys was based on the *Classification of Occupations* 1980 (CO80) as used for the 1981 Census Two elements, Occupation Code and Employment Status, were coded This enabled Socio-economic Group (SEG) and Registrar General's Social Class to be derived by reference to a look-up table, and added to the dataset In addition, the Goldthorpe - Heath (revised Goldthorpe) class schema was also derived from a look-up table and added to the data-file

In 1991, however, OPCS introduced a new occupation coding schema, the *Standard Occupational Classification* (SOC), and the new schema has been used for the occupation coding on the 1991 and 1993 BSA surveys The reasons why a new schema was developed are explained in OPCS (1991a, 1991b) Social Class and SEG were rebased on SOC according to the principle of 'maximum continuity,' that is, the number of jobs (and hence persons) allocated to the same Social Class or SEG category as when they were based on CO80 was maximised In practice, OPCS has established that overall, 2.3 per cent of jobs were assigned to a different Social Class due to the rebasing on SOC, and 2.0 per cent of jobs to a different Socio-economic Group (see OPCS, 1991b) The net redistribution of cases due to rebasing on SOC is therefore small, but since most of the change is concentrated in

particular categories, the impact of change on those categories can be substantial (see OPCS, 1991b, p.15).¹⁹

"Occupations are viewed in SOC as coherent sets of work activities carried on by individuals. In defining occupational groups, the aim has been to distinguish as far as possible in terms of the type and level of skills required to carry out the main work activities" (SOC, vol.3, p.2). The classification system comprises 371 Occupational Unit Groups (OUGs), the most detailed categories into which job titles and activities are coded. This 3-digit code for occupation is keyed for both the respondent [RSOC], and for the respondent's spouse or partner [SSOC] where there is a spouse or partner in the household.

Occupational Unit Groups have been aggregated as derived variables as follows:

- V11a) SOC Minor Groups, comprising 77 categories [RMINGRP] for respondents; [SMINGRP] for spouses/partners
- V11b) SOC Sub-major Groups, comprising 22 categories [RSMAJGRP] for respondents; [SSMAJGRP] for spouses/partners
- V11c) SOC Major Groups, comprising 9 categories [*RMAJGRP*] for respondents; [*SMAJGRP*] for spouses/partners.

Occupation details were collected for all respondents (and, where appropriate, their spouses or partners) in a series of questions (Q.908a-k and Q.912a-j). If respondents (or spouses/partners) were not currently in paid employment, they were asked about their last occupation (or, if waiting to take up paid work already offered, about their next occupation). Thus only those who had never had a job were excluded.²⁰

A range of variables has been derived from respondents' occupational details and from those provided by respondents about their spouses/partners. Among the principal ones is the Registrar General's **Socio-economic Group (SEG)**. There are two versions of both the full and the compressed version:

- V12a) Socio-economic Group 20 categories [RSEG2] for respondents and [SSEG2] for spouses/partners
- V12b) Socio-economic Group (banded) 8 categories [RSEGGRP2] for respondents and [SSEGGRP2] for spouses/partners.

The second version of each of these derived variables is included in the dataset to maintain comparability with practice in earlier years of the survey series:

¹⁹ On inspection, however, the BSA 1991 occupational data do show some (unexpected) discontinuities from 1990 data, mainly in the 'junior non-manual' socio-economic group. Investigations are under way to try to establish whether or not this is a result of the change from CO80 to SOC. Further information may be obtained from SCPR on request.

²⁰ This differs from the practice adopted in the 1983 *British Social Attitudes* survey, when respondents coded as 'in full-time education', 'permanently sick or disabled', 'looking after the home' or 'doing something else' were not asked for their occupational details.

- V12c) Socio-economic Group 17 categories [RSEG] for respondents and [SSEG] for spouses/partners
- V12d) Socio-economic Group (banded) 9 categories [RSEGGRP] for respondents and [SSEGGRP] for spouses/partners

(see SOC, vol 3, pp 13-14)

Also derived from occupational data are respondents' and spouse/partners' Employment Status, and Registrar General's Social Class

- V13) Employment status 11 categories [REMPSTAT] for respondents and [SEMPSTAT] for spouses/partners
- V14a) Social Class 6 categories [*RRGCLASS*] for respondents and [*SSGCLASS*] for spouses/partners

The six Social Class categories have been dichotomised into non-manual and manual in the following derived variable

V14b) Whether in a non-manual or manual job [RMANUAL] for respondents and [SMANUAL] for spouses/partners

This used to emerge automatically from the programme that creates the Social Class variable However, with the change to SOC, this no longer happens Instead it is derived separately from a combination of SOC and Employment Status codes Full details are given in Appendix G

In addition, John Goldthorpe's (revised) class schema (here referred to as **Goldthorpe-Heath**) is also coded This system classifies occupations by their 'general comparability', considering such factors as sources and levels of income, economic security, promotion prospects, and level of job autonomy and authority As for SEG and Social Class, it is based on the current or last job held

The full Goldthorpe-Heath schema has eleven categories, to which we have added a residual category of those who have never had a job or who have given insufficient information to allow classification

V15a) Goldthorpe-Heath class schema - 12 categories (including not-classifiable) [RGHCLASS] for respondents and [SGHCLASS] for spouses/partners

Instead of the full schema, a compressed schema of five classes (plus a residual category described above) is often employed

- 1 <u>Salariat</u> (professional and managerial)
- 2 <u>Routine non-manual workers</u> (office and sales)
- 3 <u>Petty bourgeoisie</u> (the self-employed, inc farmers, with and without employees)
- 4 Manual foremen and supervisors
- 5 <u>Working class</u> (skilled, semi-skilled and unskilled manual workers, personal service and agricultural workers)

This is derived variable:

V15b) Goldthorpe-Heath class schema (compressed) - 5 categories [RGHGRP] for respondents and [SGHGRP] for spouses/partners.

5.5 Industry

All respondents for whom an occupation was coded were allocated a Standard Industrial Classification (SIC) code (CSO as revised 1980). For a full listing of SIC categories, see Appendix F. The variable names are [RSIC] for the respondent, and [SSIC] for his or her spouse/partner, located at positions 798 and 799 respectively. SIC also appears compressed as a derived variable:

V16a) Standard Industrial Classification (compressed) - 11 categories (including not classifiable) [RINDDIV] for respondents and [SINDDIV] for spouses/partners.

Respondents with an occupation were also allocated a Sectoral Location, being divided into public sector services, public sector manufacturing and transport, private sector manufacturing and private sector non-manufacturing. This was done by cross-analysing SIC categories with responses to a question about the type of employer worked for. A similar exercise was carried out for spouses/partners. The derived variable is:

V16b) Sectoral Location - 5 categories (including not classifiable) [RINDSECT] for respondents and [SINDSECT] for spouses/partners.

5.6 Attitude scales

Following methodological work carried out by Heath *et al* (1986), *British Social Attitudes* survey questionnaires have regularly carried three attitudinal scales, designed respectively as measures of **egalitarianism**, **libertarianism** and **welfarism** (and their opposites). The scales are intended to be general, concentrating on underlying values and excluding items referring to specific policy issues.²¹

The measure of **egalitarianism** (the political 'left-right' dimension) is concerned primarily with issues of redistribution and equality, and is very effective in distinguishing party identification. It comprises five items, asked on the A version of the self-completion questionnaire:

- Q.A2.28 a. Government should redistribute income from the better-off to those who are less well-off [REDISTRB]
 - b. Big business benefits owners at the expense of workers [BIGBUSNN]
 - c. Ordinary people do not get their fair share of the nation's wealth [WEALTH]

²¹ For further details, see Heath, A., Jowell, R., Curtice, J. and Witherspoon, S. (1986), End of Award Report to the ESRC: Methodological Aspects of Attitude Research, London: SCPR.

- d There is one law for the rich and one for the poor [RICHLAW]
- e Management will always try to get the better of employees if it gets the chance [INDUST4]

The measure of **authoritarian/libertarian** values is concerned with the need for society to maintain a state of order and security *versus* the right within a democracy for individuals to maintain their civil liberties. The six items were asked on the A version of the 1993 self-completion questionnaire

- Q A2 29 a Young people today don't have enough respect for traditional British values [TRADVALS]
 - b People who break the law should be given stiffer sentences [STIFSENT]
 - c For some crimes, the death penalty is the most appropriate sentence [DEATHAPP]
 - d Schools should teach children to obey authority [OBEY]
 - e The law should be obeyed, even if a particular law is wrong [WRONGLAW]
 - f Censorship of films and magazines is necessary to uphold moral standards [CENSOR]

The scale designed to measure individualistic versus welfarist values comprised eight items and was included on both the A and B versions of the 1993 self-completion questionnaire

| Q A2 26/B2 66 | а | The welfare state makes people nowadays less willing to look after |
|---------------|---|--|
| | | themselves [WELFRESP] |

- b People receiving social security are made to feel like second class citizens [WELFSTIG]
- c The welfare state encourages people to stop helping each other [WELFHELP]
- d The government should spend more money on welfare benefits for the poor, even if it lends to higher taxes [MOREWELF]
- e Around here, most unemployed people could find a job if they really wanted one [UNEMPJOB]
- f Many people who get social security don't really deserve any help [SOCHELP]
- g Most people on the dole are fiddling in one way or another [DOLEFIDL]
- h If welfare benefits weren't so generous, people would learn to stand on their own two feet [WELFFEET]

Experimental work to test various ways of administering these scales has been undertaken on the 1991 and 1994 *British Social Attitudes* surveys The findings of the most recent experiment will be reported in a forthcoming CREST Working Paper

6. SAMPLING ERRORS

No sample precisely reflects the characteristics of the population it represents because of both sampling and non-sampling errors. If a sample were designed as a simple random sample (i.e. if every adult had an equal and independent chance of inclusion in the sample) then we could calculate the sampling error of any percentage, p, using the formula:

s.e. (p) =
$$\sqrt{\frac{p(100 - p)}{n}}$$

where n is the number of respondents on which the percentage is based. Once the sampling error had been calculated, it would be a straightforward exercise to calculate a confidence interval for the true population percentage. For example, a 95 per cent confidence interval would be given by the formula:

$$p \pm 1.96 x s.e. (p)$$

Clearly, for a simple random sample (srs) the sampling error depends only on the values of p and n. However, simple random sampling is almost never used in British surveys because of its inefficiency in terms of time and cost.

As noted above, the *British Social Attitudes* sample, like that drawn for most large-scale surveys, was clustered according to a stratified multi-stage design - in this case, into 176 postcode sectors. With a complex design like this, the sampling error of a percentage giving a particular response is not simply a function of the number of respondents in the sample and the size of the percentage; it also depends on how that percentage response is spread within and between postcode sectors.

The complex design may be assessed relative to simple random sampling by calculating a range of design factors (DEFTs) associated with it, where

$$DEFT = \sqrt{\frac{Variance of estimator with complex design, sample size n}{Variance of estimator with srs design, sample size n}}$$

and represents the multiplying factor to be applied to the simple random sampling error to produce its complex equivalent. A design factor of one means that the complex sample has achieved the same precision as a simple random sample of the same size. A design factor greater than one means the complex sample is less precise than its simple random sample equivalent.

If the DEFT for a particular characteristic is known, a 95 per cent confidence interval for a percentage may be calculated using the formula:

 $p \pm 1.96 x$ complex sampling error (p)

=
$$p \pm 1.96 \text{ x DEFT x } \sqrt{\frac{p(100-p)}{n}}$$

Calculations of sampling errors and design effects were made using the Word Fertility Survey 'Clusters' programme

The table below gives examples of the DEFTs and confidence intervals calculated For most attitudinal questions asked of the whole sample, we can see that the confidence interval is usually around plus or minus two per cent of the survey proportion, so we can be 95 per cent certain that the true population proportion is within two per cent (in either direction) of the proportion we report

| Class | ification variables | % (p) | Complex standard error of p (%) | 95 per cent confidence interval | DEFT |

| | Agree | 35 0 | 14 | 32 5 - 38 0 | 0 99 |
| | Disagree | 478 | 15 | 44 8 - 50 9 | 1 06 |
| | Neither agree nor disagree | 169 | 11 | 147 - 192 | 1 03 |
| | | · | | | |

However, as can be seen, for certain variables (those most associated with the area a person lives in) we find the confidence interval is plus or minus three per cent or more. This is particularly so for party identification and housing tenure. For instance, Labour identifiers and local authority tenants tend to be concentrated within certain areas; consequently there is proportionately more variation in a clustered sample than there would be in a simple random sample. But for most variables, especially attitudinal ones, the use of standard statistical tests of significance (based on the assumption of srs) is unlikely to be misleading. The confidence interval calculations are based on the total sample from the 1993 survey (2,945 weighted and unweighted), or on A version respondents (1,493 weighted, 1,484 unweighted) or B version respondents (1,452 weighted, 1,461 unweighted). As the examples above show, sampling errors for proportions administered on only one version of the questionnaire, or based on subgroups within the sample, are somewhat larger than they would have been had the questions been asked of everyone.

7. STRUCTURE OF THE QUESTIONNAIRES

As already noted, two different versions of the questionnaire were used (versions A and B). Each contained a 'core' of standard attitudinal and classificatory questions, but the middle part covered different topic areas according to which version was used. The structure of the personal interview and self-completion questionnaires administered in Britain, and the topics covered by each, is shown overleaf. For ease of reference, the contents of the *Northern Ireland Social Attitudes* questionnaires are shown alongside.

II NORTHERN IRELAND SOCIAL ATTITUDES

1. THE SURVEY

In 1993, the survey was again extended to include Northern Ireland, with funding coming from all the government departments in Northern Ireland.²²

For the first time in 1993, the data for the survey was collected by interviewers using Computer-Assisted Personal Interviewing (CAPI). Interviewers with prior experience in CAPI techniques keyed responses directly into a lap-top computer via the 'computer-generated' questionnaire (see **Part I, Section 4.1** below).

In 1993, as in previous years, core questions were asked in both surveys, but in addition there was a special module in the Northern Ireland questionnaire; this year the module was mainly concerned with community relations (Qs. 52-70 on the interview questionnaire and Qs. 2.25-2.28 on the self-completion questionnaire). To maintain the time-series, many items from the 1989, 1990 and 1991 surveys were repeated. Some of these questions were asked in Britain too (on version **B**), so allowing comparisons of the attitudes of those living in Northern Ireland with the attitudes of people in Britain. The structure of the Northern Ireland questionnaire, and its relationship to the British questionnaire, is shown in **Part I, Section 2.7** above.

Researchers from SCPR, the Policy Planning and Research Unit (PPRU) in Belfast (which also carried out the sampling and the fieldwork) and the Central Community Relations Unit in Belfast met in the months before fieldwork to plan the survey and design the questionnaire module. As with all questionnaire modules, however, final responsibility for its coverage and wording remains with SCPR.

We give below brief details of the methodology of the Northern Ireland Social Attitudes survey. Further information may be obtained from Dr. Kevin Sweeney and his colleagues at the Central Survey Unit, PPRU, 2nd Floor, Londonderry House, Chichester Street, Belfast BT1 4SX.

2. THE SAMPLE

2.1 Selection of addresses

The survey was designed to yield a representative sample of all adults aged 18 or over living in private households in Northern Ireland.

The sample was drawn from the rating list, the most up-to-date listing of private households, made available to PPRU for research purposes. People living in institutions (though not in private households in such institutions) were excluded.

²² A full account of the survey methodology will be found in Sweeney, K. and McClelland, A. 'Technical details of the survey', in Breen, R., Devine, P. and Robinson, G. (eds.) (1995, forthcoming), Social Attitudes in Northern Ireland: the Fourth Report. Belfast: Appletree Press.

A combination of the small geographical size of Northern Ireland, the generally low population density (outside the Greater Belfast area) and the extent of coverage of PPRU's fieldforce mean that it is not necessary to cluster addresses within areas The sample was therefore a simple random sample of all households listed on the rating list Addresses were selected from a computer-based copy of the rating list using a NAG random-number-generation routine (The addresses selected for all surveys conducted by PPRU are excluded from further sampling for a period of two years) Before addresses were selected, the rating list file was stratified into three geographical areas Belfast, East Northern Ireland and West Northern Ireland Within each of these strata a simple random sample of addresses was selected, with probability proportionate to the number of addresses in that stratum The issued sample was 1,400 addresses

2.2 Selection of individuals

The ratings list provides a good sampling frame of *addresses*, but contains no information about the number of *people* living at an address So a further selection stage was required to convert the listing of addresses to a listing of individuals

Interviewers were instructed to call at each address issued in their assignments They then had to list all people resident at the address who were eligible for inclusion in the sample that is, all persons aged 18 or over living at the address From this listing of eligible adults, one was selected for interview by a random procedure (part of the CAPI programme)

3. WEIGHTING

In Northern Ireland, addresses could not be selected with probability proportionate to the size of the household (as with the electoral register sampling used in *British Social Attitudes*) So before the analysis, the data were weighted to adjust for the fact that individuals living in large households had a lower chance than individuals in small households of being included in the sample As the table below shows all the weights fell within a range between one and seven and the average weight applied was 2 (1 98)

| No of adults | | | | |
|--------------|--------|-----|------|---------------|
| 18 and over | Weight | No | % | Scaled weight |
| 1 | 1 | 248 | 29 5 | 0 505 |
| 2 | 2 | 437 | 519 | 1 010 |
| 3 | 3 | 102 | 12 1 | 1 515 |
| 4 | 4 | 41 | 49 | 2 020 |
| 5 | 5 | 11 | 13 | 2 525 |
| 6 | 6 | 2 | 02 | 3 030 |
| 7 | 7 | 1 | 01 | 3 535 |

Thus, 30 per cent of households had only one adult present, 52 per cent were two-adult households, 12 per cent were three-adult households, and so on The weighted sample was then scaled back to the size of the unweighted sample, yielding a total of 842 cases and an average scaled weight of one

4. DATA COLLECTION AND RESPONSE

4.1 Computer-Assisted Personal Interviewing

In 1993, for the first time on NISA, the face-to-face interview was conducted using computerassisted interviewing techniques. The questionnaire, including all questions and routing, was programmed with the Blaise software package. Responsibility for production of the programmed questionnaire was shared between SCPR and PPRU.

The fieldforce for the 1993 NISA survey comprised interviewers who had been fully trained to operate the lap-top computers and who had prior experience working on other PPRU surveys involving CAPI techniques.

4.2 Fieldwork

Fieldwork in Northern Ireland began in late February 1993. ?? per cent of interviews were carried out in February and March, with the remaining ?? interviews carried out later.

Fieldwork was conducted by 74 interviewers drawn from PPRU's panel. All attended a oneday briefing conference to familiarise them with the selection procedures and the questionnaires. The interview took, on average, 61 minutes to administer.

Overall response achieved was:

| | Number | % |
|--------------------------------------|--------|-----|
| Addresses issued | 1400 | |
| Vacant, derelict, other out of scope | 144 | |
| In scope | 1265 | 100 |
| Interview achieved | 842 | 67 |
| Interview not achieved | 414 | 33 |
| Refused* | 348 | 28 |
| Not contacted* | 41 | 3 |
| Other non-response | 25 | 2 |

* For definitions, see Part I, Section 4.3 above

A response rate of 68 per cent was achieved in Belfast and 64 per cent in East Northern Ireland; it was 71 per cent in West Northern Ireland.

As in the *British Social Attitudes* survey, respondents were asked to fill in a self-completion questionnaire which was, whenever possible, collected by the interviewer. Otherwise, the respondent was asked to post it direct to a Northern Ireland Post Office Box from which it was forwarded, through PPRU, to SCPR. If necessary, up to two postal reminders were sent to obtain the self-completion questionnaire from those who had not returned it. In all, 767 respondents returned the self-completion questionnaire, 91 per cent of those interviewed.

4.3 Advance letter

Although previous experiments have shown that the effect of sending an advance letter to respondents on overall response is negligible, it is popular with both interviewers and respondents. It has therefore become standard practice on the NISA surveys to send out a letter which briefly describes the purpose of the survey and the coverage of the questionnaire, and asks for co-operation when the interviewer calls A copy will be found in Appendix H. (See also **Part I, Section 4.5** above)

5 DATA PREPARATION AND ANALYSIS

5.1 Data preparation

The completed questionnaires were edited in CADI (Computer-Assisted Data Input) by PPRU and SCPR **Appendix D** contains a copy of the paper version of the main questionnaire (reproduced from the CAPI questionnaire) and a copy of the self-completion questionnaires with weighted marginals (percentages) and variable names Coding frames and coding instructions are reproduced in **Appendix** E

5.2 Analysis variables

Analysis variables were mostly the same as those used in the British survey (see Appendix G) There were two exceptions questions about party identification included Northern Irish political parties The relevant derived variables are

| V8a) | [NIPYALG1] |
|------|------------|
| V8b) | [NIPTYID2] |
| V8c) | [NIPYALG2] |
| V8d) | [NITYID4] |

In addition, the Northern Ireland Social Attitudes questionnaire carried some questions about mixed or integrated schooling (Q 904 [SLFMXSCH] and Q 906 [CHDMXSCH]

5.3 Sampling errors

Because the Northern Ireland Social Attitudes survey is based on a simple random sample, there are no complex sampling errors to calculate The sampling error of any percentage, p, can be calculated using the formula

se (p) =
$$\sqrt{\frac{p(100 - p)}{n}}$$

where n is the number of respondents on which the percentage is based

The absence of design effects in the Northern Ireland Social Attitudes survey (and therefore of the need to calculate complex standard errors) means that the standard error and confidence

intervals for percentage estimates from NISA are only slightly greater than for the British survey, despite the smaller sample size of the former.

The table below gives examples of the sampling errors and confidence intervals for a range of percentage estimates from the *Northern Ireland Social Attitudes* survey.

| | | % (p) | Standard error of p (%) | 95 per cent confidence interval | 95 per cent confidence limits |
|-----------------------|---|-------------|-------------------------------|---------------------------------------|-------------------------------------|
| Classific | ation variables | • | I • • • | | |
| Q.102a | Religion | | | | |
| - | Protestant | 57.8 | 1.7 | 3.3 | 54.5 - 61.1 |
| | Catholic | 31.5 | 1.6 | 3.1 | 28.4 - 34.6 |
| | No religion | 9.4 | 1.0 | 2.0 | 7.4 - 11.4 |
| Q.101 | Housing tenure (unweighted data) | | | | |
| • | Owns | 68.7 | 1.6 | 3.1 | 65.6 - 71.8 |
| | Rents from NIHE | 25.1 | 1.5 | 2.9 | 22.2 - 28.0 |
| Q.9 | Economic activity | | | | |
| Q.9 | Working | 47.1 | 1.7 | 3.4 | 43.2 - 49.9 |
| | Unemployed | 47.1 7.6 | 0.9 | 5.4 1.8 | 43.2 - 49.9 5.8 - 9.4 |
| | Onempioyed | 7.0 | 0.9 | 1.0 | J.0 - 9.4 |
| Attitudinal variables | | | | | |
| Q.40 | UK should have closer links with | | | | |
| → | the European Community | 40.2 | 1.7 | 3.3 | 36.9 - 43.5 |
| Q.58a | Prefer to live in a mixed | | | | |
| Q.30a | religion neighbourhood | 73.7 | 1.5 | 3.0 | 70.7 - 76.7 |
| | 2 2 | , 5. , | 1.0 | 2.0 | 70.7 - 70.7 |
| Q93a | In favour of paying farmers to | | | • | |
| | to change to organic farming | 46.6 | 1.7 | 3.4 | 43.2 - 50.0 |
| Q.20b | Workplace is quite well-managed | | | | |
| | (employees only) | 49.0 | 2.8 | 5.4 | 43.6 - 54.4 |
| Q.2.08b | (Self-completion) Willing to pay more | | | | |
| | in taxes to protect the environment | 31.7 | 1.7 | 3.3 | 28.4 - 35.0 |
| 0 2 26- | (Self-completion) Exams are the best | | | | |
| Q.2.302 | (Sen-completion) Exams are the best way of judging ability | 61.1 | 1.8 | 3.5 | 57.6 - 64.6 |
| | way of Judging aonity | 01.1 | 1.0 | 5.5 | J7.0 - 04.0 |

Thus a percentage estimate of 10 per cent (or 90 per cent) from the Northern Ireland Social Attitudes survey has a standard error of 1.0 per cent and a 95 per cent confidence estimate of $\pm/-2$. A percentage estimate of 50 per cent has a standard error of 1.7 per cent and a 95 per cent confidence interval of $\pm/-3.3$ per cent. As the example above shows, sampling errors for proportions based on sub-groups within the sample are somewhat larger than they would have been, had the questions been asked of everyone.

P 1235/GB BRITISH SOCIAL ATTITUDES 1993 SELF-COMPLETION QUESTIONNAIRE

Spring 1993

To the selected respondent:

Thank you very much for agreeing to take part in this important study - the ninth in this annual series. The study consists of this self-completion questionnaire, and the interview you have already completed. The results of the survey are published in a book each autumn, some of the questions are also being asked in twenty other countries, as part of an international survey.

Completing the questionnaire.

The questions inside cover a wide range of subjects, but each one can be answered simply by placing a tick (\checkmark) or a number in one or more of the boxes. No special knowledge is required we are confident that everyone will be able to take part, not just those with strong views or particular viewpoints. The questionnaire should not take very long to complete, and we hope you will find it interesting and enjoyable. It must be filled in only by the person actually interviewed at your address. The answers you give will be treated as confidential and anonymous

Returning the questionnaire.

Your interviewer will arrange with you the most convenient way of returning the questionnaire. If the interviewer has arranged to call back for it, please fill it in and keep it safely until then. If not, please complete it and post it back in the pre paid, addressed envelope, AS SOON AS YOU POSSIBLY CAN

THANK YOU AGAIN FOR YOUR HELP

Social and Community Planning Research is an independent social research institute registered as a charitable trust. Its projects are funded by government departments, local authorities, universities and foundations to provide information on social issues in Britain The British Social Attitudes survey series is funded mainly by one of the Sainsbury Family Charitable Trusts, with contributions also from other grant-giving bodies and government departments. Please contact us if you would like further information

THANK YOU VERY MUCH FOR YOUR HELP

Please keep the completed questionnaire for the interviewer if he or she has arranged to call for it. Otherwise, please post it <u>as soon as possible</u> in the pre-pald addressed envelope provided

BRITISH SOCIAL ATTITUDES 1993

SELF-COMPLETION QUESTIONNAIRE

To the selected respondent.

P 1235/GB

Thank you very much for agreeing to take part in this important study - the ninth in this annual series The study consists of this self-completion questionnaire, and the interview you have already completed. The results of the survey are published in a book each autumn, some of the questions are also being asked in twenty other countries, as part of an international survey

Completing the questionnaire.

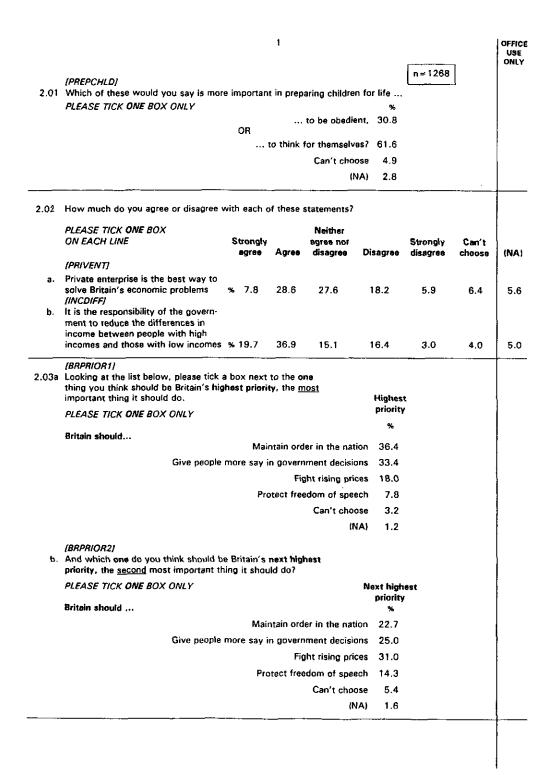

The questions inside cover a wide range of subjects, but each one can be answered simply by placing a tick (\checkmark) or a number in one or more of the boxes. No special knowledge is required we are confident that everyone will be able to take part, not just those with strong views or particular viewpoints. The questionnaire should not take very long to complete, and we hope you will find it interesting and enjoyable. It must be filled in only by the person actually interviewed at your address. The answers you give will be treated as confidential and anonymous

Returning the questionnaire.

Your interviewer will arrange with you the most convenient way of returning the questionnaire. If the interviewer has arranged to call back for it, please fill it in and keep it safely until then If not, please complete it and post it back in the pre-paid, addressed envelope, AS SOON AS YOU POSSIBLY CAN

THANK YOU AGAIN FOR YOUR HELP

Social and Community Planning Research is an independent social research institute registered as a charitable trust. Its projects are funded by government departments, local authorities, universities and foundations to provide information on social issues in Britain The British Social Attitudes survey series is funded mainly by one of the Sainsbury Family Chantable Trusts, with contributions also from other grant-giving bodies and government departments Please contact us if you would like further information

| 46a. | Now I would like to ask you about two economic problems - <u>inflation</u> and <u>unemployment</u> . [PRICES] First, <u>inflation</u> : in a year from now, do you expect prices generally to have gone up, to have stayed the same, or to have gone down? IF GOME UP OR GONE DOWN: By a lot or a little? | ł | |
| | To have gone up by a lot | 39.1 | |
| | To have gone up by a little | 46.0 | |
| | To have stayed the same | 10.2 | |
| | To have gone down by a little | 2.5 | |
| | To have gone down by a lot | 1.2 | |
| | (Don't know) | 1.0 | |
| b. | [UNEMP] Second, <u>unemployment</u> : in a year from now, do you expect unemployment to have gone up, to have stayed the same, or to have gone down? IF GONE UP OR GONE DOWN: By a lot or a little? | ž | |
| | To have gone up by a lot | 41.0 | |
| | To have gone up by a little | 33.4 | |
| | To have stayed the same | 16.9 | |
| | To have gone down by a little | 5.8 | |
| | To have gone down by a lot | 1.6 | |
| | (Don't know) | 1.3 | |
| 47a. | [UNEMPINF] If the government <u>had</u> to choose between keeping down inflation or keeping down unemployment, to which do you think it should give highest priority? | * | |
| | Keeping down inflation Keeping down unemployment | 26.4 70.6 | |
| | Other (WRITE IN) | 1.6 | |
| | (DK) | 1.4 | |
| Ъ. | [CONCERN] Which do you think is of the most concern to <u>you and your family</u> READ OUT | 1.4 | |

NORTHERN IRELAND SOCIAL ATTITUDES 1993

SELF-COMPLETION QUESTIONNAIRE

Spring 1993

To the selected respondent

Thank you very much for agreeing to take part in this important study - the fourth in this annual series The study consists of this self-completion questionnaire, and the interview you have already completed The results of the survey are published in a book each autumn, some of the questions are also being asked in twenty other countries, as part of an international survey

Completing the questionnaire

The questions inside cover a wide range of subjects, but each one can be answered simply by placing a tick (\mathcal{A}) or a number in one or more of the boxes. No special knowledge is required we are confident that everyone will be able to take part, not just those with strong views or particular viewpoints. The questionnaire should not take very long to complete, and we hope you will find it interesting and enjoyable. It must be filled in only by the person actually interviewed at your address. The answers you give will be treated as confidential and anonymous

Returning the questionnaire

Your interviewer will arrange with you the most convenient way of returning the questionnaire. If the interviewer has arranged to call back for it, please fill it in and keep it safely until then If not, please complete it and post it back in the pre-paid, addressed envelope, AS SOON AS YOU POSSIBLY CAN

THANK YOU AGAIN FOR YOUR HELP

Social and Community Planning Research is an independent social research institute registered as a charitable trust. Its projects are funded by government departments, local authorities, universities and foundations to provide information on social issues in the UK This survey series has been funded mainly by one of the Sainsbury Family Charitable Trusts, with contributions also from other grant-giving bodies and government departments. Please contact us if you would like further information

B: Questions for which listings of other answers are available

A, B and NI versions

Q.1b Notes for coding regular readership of daily morning newspapers

The following papers are all daily morning papers, NOT `free sheets', which should be coded 94 on cols 230-31, and final listed with serial numbers at Q lb

Do not include free papers, note any other papers mentioned (as these have to be checked first to see that they are indeed <u>daily morning</u> newspapers) In that way this list can be kept up-to-date

Birmingham Post Daily News Daily Post Dundee Courier Eastern Daily Press East Anglian Times Glasgow Herald Irish Press Jang Liverpool Post Newcastle Journal Northern Echo Press & Journal The Scotsman Western Daily Press Western Mail Western Morning News Yorkshire Post

N.B. These papers are coded 94 if <u>and only if</u> they are the only papers mentioned. If two or more papers are mentioned (one national and one regional), then use code 96, delete any other codes and final list both papers with serial numbers. A, B and NI versions

Q.6 (A and B) Notes on coding Q.4 (NI)

This question asks whether `benefits for the unemployed are <u>too low</u> and cause hardship' (code 1), or whether they are `<u>too high</u> and discourage people from finding jobs' (code 2).

In addition to Don't know (code 8) and Not answered (code 9), there are 4 additional codes (added in 1984).

4 Both: Unemployment Benefit causes hardship but can't be higher or there would be no incentive to work

Include here if main mention is that benefit discourages people from working that wages are so low that benefit is "disincentive" that minimum wage is too close to benefit level, etc.

In short, any <u>comparison</u> of benefit level to wages, that benefit level in relation to wages doesn't pay people to work, etc.

5 Both: Unemployment Benefit causes hardship to some, while others benefit

Here the point is slightly different - that some categories of people gain (unjustly) from getting benefit (unjustly) whilst others suffer.

So here include distinctions made between "genuine" claimants and "scroungers", people with families *versus* young people, differences between North and South, etc.

6 About right/in between

All mentions that level of benefit is about right, is enough with careful management, etc.

- 7 All other answers please TAB first, then list with serial no.
- NB Sometimes there is some difficulty in deciding between codes 4 and 5 -partly because both reasons are given. Need to decide "main reason" -either most elaborated and detailed reason or first mention if both mentions are short. The important thing to remember is that code 4 relates the answer to level of <u>wages</u> while code 5 is about dividing claimants into two different groups.

If you have any doubts, please TAB.

__ __

A, B versions

Q.17 (A and B) Notes on coding

This question asks whether respondents think employees doing the same job should always be given the same pay (code 1), should be paid according to qualifications (code 2) or should be paid according to how well they do their job (code 3).

Respondents who felt codes 2 and 3 applied equally will be coded as 5

A, B and NI versions

Q.27b (A and B) Notes on coding Q.18b (NI)

This question asks employees, who say they have been unemployed during the last 5 years, how many months this period of unemployment has lasted.

Respondents who have been unemployed for less than one month will be coded as 1.

A, B and NI versions

Q.28a (A and B) Notes on coding Q.19a (NI)

This question asks employees whether at their place of work there are unions (code 1) or staff association (code 2).

Respondents who said that at their place of work they have both trade union(s) and a staff association are coded as 4

A and B versions

Q.32b (A and B) Notes on coding

This questions ask of employees who have a system for reviewing or reporting work performance in their present job how often these reviews or reports take place.

If reports take place once a month or less frequently, code 1 will be entered

A, B and NI versions

Q.53b (A and B) Notes on coding Q.29b (NI)

This question asks unemployed people how long they have been unemployed and seeking work since March 1988.

Respondents who answered less than a month, will be coded as 1

A and NI versions

Q.71b (A) Notes on coding Q.82b (NI)

This question asks whether British university students should pay something towards their own teaching fees (code 1) or whether local authorities should continue to pay the whole amount (code 2).

Respondents who said `it depends' will be coded as 3.

B and NI versions

Q.72a (B) Notes on coding Q.95a (NI)

This question asks if it is discovered that some of a factory's waste has begun leaking into a nearby river whether the factory should just be asked to do something about it (code 1), whether the factory should be heavily fined for every week it continues (code 2) or whether the factory should be shut down unless it does something about it (code 3).

If both codes 2 and 3 are rung, recode to 3.

B and NI versions

Q.80a (B) Notes on coding Q.42a (NI)

This question asks whether the long-term policy for Northern Ireland should be for it to remain part of the United Kingdom (code 1) or whether it should reunify with the rest of Ireland (code 2).

In addition to Other answer (code 7), Don't know (code 8) and Not answered (code 9), there are 2 additional codes (added in 19??).

4 Northern Ireland should be split up into two

5 It should be up to the Irish to decide

B and NI versions

Q.80b (B) Notes on coding Q.42b (NI)

This question asks whether respondents support or oppose a complete withdrawal of British troops from Northern Ireland.

In addition to Other answer (code 7), Don't know (code 8) and Not answered (code 9), there are 2 additional codes (added in 19??).

4 Troops should be withdrawn in the long-term, not immediately

5 It should be up to the Irish to decide

B and NI versions

Q.85b (B) Notes on coding Q.47b (NI)

This question asks respondents whether inflation (code 1) or unemployment (code 2) is more of a concern to them and their family.

If respondents said both were of equal concern, code 4 will be used

B and NI versions

Q.94 (B) Notes on coding Q.75 (NI)

This question gives respondents a hypothetical example in which two people working for a large firm become unemployed through no fault of their own. One worker had a very high income, the other a very low income. The respondents are asked whether the high earner should be entitled to more unemployment benefit than the low earner (code 1), the same amount, less benefit, or no unemployment benefit at all.

If more than one answer has been rung, recode to 8

A, B and NI versions

Q.102a, 102b

Religious affiliation. Rules for coding `other answers' (codes 27, 08 and 14)

First, you need to distinguish between Other Protestant (code 27) and Other Christian (code 08).

Other Protestant (27) should include members of any church that separated from the Catholic Church in the sixteenth century, or any church, chapel or group that separated from a church that itself separated from the Catholic Church in the 16th century. In practice, this means any <u>Western</u> Christian church that is not Catholic.

Also included would be people who say "Protestant", but do not name any specific church or denomination.

So included under other Protestant would be any of the following (which should also be final listed with serial numbers):

Apostolic Church Church of Christ Church of God Church of Nazarene Church of Sweden Christadelphians Christian Scientist Congregational Covenanter Elim English Church Mission Evangelical; Evangelical Christian German Evangelist House Chuch Movement Independent Chapel `Interdenominational' Jehovah's Witness Lutheran Moravian Mormon New Testament Church `Non-conformist' Pentecostal Salvation Army Society of Friends/Quakers Unitarian

N.B. Other codes to be TABBED so that they can be added to this list.

Codes like "Independent Methodist" and "Wesleyan Reform" are to be coded under "Methodist" (code 06); varieties of Presbyterian to be coded under "Presbyterian" (codes 07 or 21); Church in Wales which is part of the Anglican Communion under "Church of England" (code 04); etc. NOTE THAT `CHURCH OF IRELAND' CAN BE RECODED 04

E6

Religious affiliation. Rules for coding "other answers' (cont'd)

Other Christian (code 08) should include any of the ORTHODOX churches - that is churches which developed separately from the Catholic Church, or split from it before the 16th century, and are either the <u>Eastern</u> or <u>Greek</u> branches of Christianity

It would also include people who say "Christian, but no denomination"

So included under this category would be

`Christian Orthodox' Greek Orthodox Russian Orthodox Serbian Orthodox

N.B. Please TAB any other categories so that they can be added to this list; all other answers should be final listed with serial numbers.

The final category, **Other non-Christian (code 14)** can include other clearly non-Christian religions. Examples might be.

Baha'i Believer in God, but not Christian Church of God of Prophecy Hare Krishna Eumanist Satanist Spirit worship Wicca, or white witchcraft

N.B. Please TAB any other categories so that they can be added to this list; all other answers should be final listed with serial numbers.

A, B and NI versions

Q.908g (A,B) Notes on coding Q.910g (NI)

At this question employees are shown a card and asked to say what type of organisation they work for Interviewers are instructed to code the first answer that applies. Interviewers rang code 7 and noted respondents' answers if their option did not appear on the card.

The only other answer given was `university' The vaule label for code 7 (`other answer')will be changed to `university'
