## VARIABLE RELATIONSHIPS

### Explanatory Notes

---

#### Definitions:

A *SOURCE VARIABLE* is a variable that is used in some way in the derivation of a further variable. It might be used directly in the formula used for the calculation of that further variable or it might be used as a condition (e.g. the condition might be 'include information relating to heads of household only').

A *TARGET VARIABLE* is the variable that is derived using the source variables.

#### Part 1 - List of target variables showing source variables

This part lists, for each target variable, the immediate source variables which are used in its derivation. The source variables shown may be used either directly in the formula used for the calculation of the target variable (source variable then shown in normal text) or as a condition on that formula (source variable then shown in italics).

In order to identify all of the variables which have an influence on the target variable, each source variable must itself be examined in turn to identify its own source variables, and so on until no further source variables are indicated.

The table name of the target variable is shown.

#### Part 2 - List of source variables showing target variables

This part lists, for each source variable, the immediate target variables in which that source variable is used. The source variable shown may be used either directly in the formulae used for the calculation of the target variables (target variable then shown in normal text) or as a condition on those formulae (target variable then shown in italics).

In order to identify all of the target variables on which a particular variable has an influence, each target variable must itself be examined in turn to identify all of its own target variables, and so on until no further target variables are indicated.

The table name of each source variable is shown.
