CLS Cohort Studies Data Note 2007/01

Employment Histories in NCDS 4, 5 and 6
1974-2000

Kelly Ward

Centre for Longitudinal Studies, Institute of Education.

1. Introduction

This Data Note reports on work done to improve the quality and consistency of the spells of employment collected for all main respondents of the National Child Development Survey, covering the period 1974 to 1999/2000. The information is based on data collected when the respondents were aged 24 (NCDS 4), 33 (NCDS 5) and 42 (NCDS 6).

This work was undertaken as part of the Gender Network Project with Professors Shirley Dex and Heather Joshi, examining the occupational mobility of men and women over the lifecourse, using the retrospective employment histories from NCDS 4, 5 and 6.

The information provided below forms part of the work undertaken to construct an employment history dataset. A separate Date Note (CLS: Programming Employment Histories in NCDS 4, 5 and 6. 2007/02) indicates the final stage of work once the cleaning had been completed. Both of these Data Notes should accompany the Employment History dataset deposited at the Data Archive. It is hoped that the information provided and the dataset will be of value to others analysing the NCDS data.

The Contents of this Data Note are structured in the following sections;

2. National Child Development Study (NCDS): A brief introduction to the NCDS survey and details of the user support group are provided.
3. NCDS Employment history: Specific details will be provided relating to the information available at NCDS 4, 5 and 6.
4. Problems encountered: Details of the problems encountered in the original employment history data and their resolution during cleaning.

All syntax used is available in the three Appendices: NCDS 4 syntax; NCDS 5 syntax, and Hand-cleaned amendments for employment dates.

2. National Child Development Study (NCDS)

The National Child Development Study (NCDS) is a continuing, multi-disciplinary longitudinal study which takes as its subjects all those living in Great Britain who were born between 3 and 9 March, 1958. NCDS began as the Perinatal Mortality Survey (PMS) in 1958 and since then six further surveys have been carried out in order to monitor the physical, educational and social development of respondents. These surveys were carried out in 1965 (NCDS1), 1969 (NCDS2), 1974 (NCDS3), 1981 (NCDS4), 1991 (NCDS5); and 1999/2000 (NCDS6).

User Support Group

This group, supported by CLS staff, provides advice and guidance on the use of NCDS data by:
- providing documentation about the data;
- collating and disseminating information on uses of the data;
- producing publications;
- producing and distributing a newsletter and working papers;
- providing access to non-computerised NCDS data;
- collecting additional information; and
- servicing the User Group.

The User Support Group can be contacted by post, 'phone, fax, or email as shown below:

Fax: +44 0207 612 6880
Email: cohort@cls.ioe.ac.uk
Internet: http://www.cls.ioe.ac.uk/ncds

3. NCDS Employment Histories

The NCDS employment histories are based on spells of employment recalled and recorded by respondents at NCDS 4, 5 and 6. Each of these interview sweeps provide different information that have been used to prepare a chronological employment history dataset to chart the moves that respondents make in and out of employment from when the respondent left full-time education to the latest interview at NCDS 6 (1999/2000). In preparing the data numerous problems were identified across the data sweeps and it is these issues that are discussed and remedied in this Data Note.

NCDS Data:

The fourth follow-up (NCDS4) of the National Child Development Study took place in 1981 when the cohort members were aged 24. 12,537 people (born between March 3-9th 1958) answered one or more sections of the study.

The fifth follow-up, NCDS 5, took place in 1991 when the cohort members were aged 33. NCDS 5 instruments included a self-completion questionnaire known as "Your Life Since 1974" which was posted to the cohort members during the course of NCDS 5 and asked for retrospective and dated information on marriages, children, jobs, non-employment, and housing from the age of 16 until the time of the 1991 survey along with the dates of marriages and births and the start and end dates of spells of employment or non-employment. Responses on some or all of these data were obtained from 11,178 cohort members. The development of this employment history dataset has relied heavily on data from the NCDS5 'Your Life Since 1974' questionnaire. The sixth follow-up (NCDS 6) took place when the cohort members were aged 42. Retrospective information relating to all spells of activity (i.e. employment, non-employment) were collected at this sweep, dating back to sweep 5.

Data were collected in spells, where a spell represents one job. Respondents were asked to delineate each spell with its start and end dates (month and year). Obviously each of these spells represents a period of employment. However, two successive spells, namely two jobs may not represent an uninterrupted period of employment unless the end date of the first spell is followed without any gap by the start date of the second spell. Where these dates are not continuous, it is assumed that a period of non-employment separated these two job spells.

In the discussion below we use the terminology as follows:

1) job spell – which is a job but also implies a period of employment
2) non-employment spell – is the gap between discontinuous job spells.
3) Hours status – is whether a job spell has been coded either working full time (code 1) or part time (code 2).

Table 1 below provides an overview of the information on employment histories available from the three sweeps of the NCDS survey, 4, 5 and 6. This table indicates the information that is available and how this information was collected and stored in the original datasets.

Table 1: Overview of employment and occupation details available.

Survey	Data Collected	Respondent	Details Collected
NCDS 4 – age 24	Collects up to four job spells. The first spell refers to the respondents' first job since leaving school. The second and third spells are jobs following on from the first. The fourth spell refers to the current or last job at the time of interview, regardless of the actual number of jobs a respondent has had. Data is arranged in the order of the first ever job to the current/most recent job i.e. 74, 76, 80.	Main respondent only.	Date job spell started - start month and start year. Date job spell ended - end month and end year. Hours status - part time or full time. Occupation classification – based on ***CO80***.
	Current employment/job at time of interview.	Partner Respondent.	Based on ***CO80*** occupation classifications.
NCDS 5 – age 33	Collects up to 12 job spells covering the period from interview (1991) back to age 16 (1974) and therefore overlaps with NCDS 4 from ages 23 to 16. Spell one refers to the earliest job spell and spell 12 refers to spell nearest to the NCDS 5 interview date. The start dates of the main respondent interview are arranged in the order of the first ever job to the current/most recent job (e.g. 74, 76, 87, 89, 91) for the majority of cases. However there are a number of cases (approximately 300) where the data uses the opposite order (e.g. 91, 89, 76, 74). There are also some overlaps in the dates where the cohort member has had two jobs at the same time, although these are not always part-time jobs.	Main and Partner Respondent – details taken from the "Your life since 1974" self completion questionnaire.	Date job spell started - start month and start year. Date job spell ended - end month and end year. Hours status - part time or full time. Occupation classification – based on ***SOC90***.
NCDS 6 – age 42	Collects up to 10 job spells dating from the interview (1999/2000) back to NCDS 5 (1991). The details collected at this sweep include spells of employment and non-employment together. Dates range from most recent job at time of interview (spell one) to last job (spell ten). This differs from the NCDS 4 and 5 as the data are stored in the opposite chronological order e.g. 97, 95, 91. The dates are also in four digit format whereas in NCDS 4 and 5 they are in two digit format.	Main respondent only.	Date job spell started - start month and start year. Hours status - part time or full time. Activity status – whether employed or non-employed. Occupation classification – based on ***SOC90***. No information are collected regarding the end dates of each spell.
	The current or most recent job at time of survey (1999/2000).	Main and Partner respondent.	Occupation details use the ***SOC90*** classifications.

4. Problems encountered

The problems encountered were highlighted when we were attempting to collate an employment history dataset that charted the moves in and out of employment and between different occupation categories from 16 to age 42. Specifically, the aim was to understand the occupational mobility of respondents over their lifecourse. This relied heavily on the month and year values available in all three of the NCDS surveys used.

Initially for each dataset (NCDS 4, 5 and 6), all missing values in the employment histories had been set to system missing. This was problematic as it was found that NCDS 4 and 5 system missing values did not distinguish between cases where the question was 'not applicable' for the respondent to answer and cases where the question was applicable but an answer was not given. This was mainly a problem for the NCDS 5 employment histories: only minor cleaning was needed and undertaken on NCDS 4. The NCDS 6 data were found to be of good quality and therefore this document focuses mainly on the cleaning undertaken on the NCDS 4 and 5 retrospective histories obtained at the cross-section interview sweeps.

To facilitate the cleaning process I used a new naming system on all variables that I had cleaned to allow comparisons to be made with the original variables. The variables were renamed using the following structure (a typical variable name could be dmjbstm or emjbedy);

> d = denotes NCDS 4 or e = denotes NCDS 5 survey,
> m = main respondent (cleaning was not undertaken for partner respondents),
> jb = job,
> st or ed = refer to a spell's *start* or *end* values respectively,
> m = refers to a spell's date *month*; y = refers to a spell's date *year*.

Start month, start year and End month, end year

All missing values on NCDS 4 and 5 employment history variables (specifically the employment dates) were checked and reassigned accordingly. This meant re-defining the system missing into either a 'don't know' (-8) category or a 'not applicable' (-1) category. A 'Don't Know' category is defined here as those who were eligible to answer the question but did not provide an answer, or were unsure of the correct answer at the time of interview. A 'Not Applicable' category is defined here as those where the question was not relevant for them to answer and they had been routed away from answering by earlier responses.

Further to this, the number of cases which had system missing codes in the month (start or end) of a job spell should correspond to the number of system

missing codes in the year (start or end) of the same spell. The following shows the frequencies of codes for a start month and start year of one example job spell.

n507415 CML:13,8a)/1 Job #1 Date Job Started-MO

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0	41	.4	.4	.4

	89	30	.3	.3	99.6
	90	21	.2	.2	99.8
	91	18	.2	.2	100.0
	Total	10795	94.1	100.0	
Missing	System	676	5.9		
Total		11471	100.0		

Firstly, the missing system codes do not have the same number of cases in both the month and year variables relating to the same spell. There are 1040 system missing values in the month variable and 676 system missing values in the year variable. While this gap points to a problem, a thorough check of all of these cases in survey sweeps 4 and 5 was required to identify which cases were

genuinely system missing, and which should have been coded as "Don't Know" (-8).

Secondly, if a spell had not ended then the value of zero was assigned. In all cases it was necessary to check these values. In some cases, spell dates were assigned a zero but had no corresponding job details. In the above example, however, for the first job, a value of zero should not occur as this marks the respondent's first job in the NCDS 5 retrospective employment history and as such these cases had to be investigated.

If a case had a value in a month variable but was missing in the corresponding year variable, the missing variable was set to Don't know (-8). If however, a case had no value in all of the month (start and end) and year (start and end) dates, and had no further details about job spells (in all variables), then that case was set to 'Not Applicable' (-1) signifying that the record of job spells had come to an end.

There was a process of checking system missing values on spell dates to see if they should be changed from 'system missing' to 'Don't know' or 'Not Applicable'. The box below provides an example of this. Job spell one has a system missing month value and job spell two has system missing codes on the start month and end year values. My policy for handling this is that each of these three system missing variables would be assigned to -8 (don't know) instead of system missing, to facilitate the identification that while a job spell has been recorded we are unsure of some of the dates.

EXAMPLE					
Job Spell One		**Job Spell Two**			
Month Ended	Year ended	Month Started	Year started	Month ended	Year ended
System missing	**1980**	**System missing**	**1982**	**7**	**System missing**

If an individual had only 3 job spells, the rest of the job spell variables allocated to storing their employment history would be recoded from system missing to 'not applicable' (-1).

During cleaning, I found other problems relating to the actual job spell dates (start and end). Some were found to be incoherent given the format of the variables and these were deemed to be coding errors. I was able to correct these individual errors on a case-by-case basis. The syntax is included in the appendix. Other errors found relate to noticeable overlaps between job spells and non-employment spells. These were investigated by examining the whole set of job spells and non-employment spells for each specific case. Again, if obvious corrections could be made, these have been implemented and the syntax is included in the Appendix.

Hours status (Full or Part time)

On variables which related to the hours status of a job spell (part time or full time) and employee status (employee, self-employed or temp) of a given job spell, I have only focused on cleaning the missing values and any inconsistent values. Any out–of-range or system missing values on hours status and employee status were set to either 'don't know' (-8) or 'not applicable' (-1).

Occupational Categories

Details about individuals' occupation categories for a job spell are not investigated in this Data Note (please see the cautionary note attached to the NCDS 4 details in the syntax section). NCDS 4 uses CO80 codes and NCDS 5 and 6 use SOC 90 codes. All had missing values correctly defined already as -8 (don't know) or -1 (not applicable) and were left unaltered.

Date structure

As previously outlined, some of the job spells in NCDS 5 were not stored in the same chronological order as the majority of cases, according to their dates, and were found to go in the reverse chronological order. Other cases were found to go from the past to the present and then turn and be stored from the present to the past direction in the middle of the employment history. These cases needed to be amended and stored in the same order as the majority of cases which is, from first employment (i.e. 1981) to most recent employment at the time of the interview (i.e. 1991).

All cases with a discrepancy were identified by simply cross-tabulating one spell's date variables by the next spell's date variable (for example, start year of spell one by end year of spell one; end year of spell one by start year of spell 2 etc). All end year values should have higher or equal values to the start year of the same spell. If any cases were found to have lower values in the end year when comparing to the start year, these were checked. All amendments to cases which were clearly in error are outlined in section three of the syntax.

In line with our project, further work was carried out. This work specifically went on to examine the cases that had a value of -8 on any of the job spell dates. For example, in some cases these missing dates were replaced by valid dates (start month and year, end month and year). The dataset we are depositing in the Data Archive with this Data Note does not contain any of these further changes, nor does the syntax included in this Data Note cover these changes. This leaves other researchers free to make their own assumptions and alterations as they see fit.

NCDS 4 cleaning – run on NCDS 4 data only

**The majority of the ncds 4 variables here require no cleaning but for consistency purposes they have been recoded to use format identified at start of this data note. Some variables required small amounts of cleaning and this is shown in the syntax **

RECODE n4143 n4144 n4145 n4147 n4149 n4150 n4152 n4154 n4156 n4158 n4159 n4161 n4163 n4165 n4167 n4168 n4170 n4172 n4174 n4176 n4177 n4179 (sysmis=-1) (98=-8) (else=copy).
value labels n4143 n4144 n4145 n4147 n4149 n4150 n4152 n4154 n4156 n4158 n4159 n4161 n4163 n4165 n4167 n4168 n4170 n4172 n4174 n4176 n4177
   n4179
-8 'Don t Know'
-1 'Not Applicable'.
execute.
missing values n4143 n4144 n4145 n4147 n4149 n4150 n4152 n4154 n4156 n4158 n4159 n4161 n4163 n4165 n4167 n4168 n4170 n4172 n4174 n4176 n4177 n4179 ().

compute dmjbstm1=n4145.
variable label dmjbstm1 "Start month first Job since school".
value labels dmjbstm1
-8 'Don t Know'
-1 'Not applicable'.
execute.

compute dmjbsty1=n4147.
variable label dmjbsty1 "Start YEAR first Job since school".
value labels dmjbsty1
-8 'Don t Know'
-1 'Not applicable'.
execute.

compute dmjbst1=n4149.
if serial='515077L' dmjbst1=-8.
if serial='683033F' dmjbst1=-8.
if serial='720097M' dmjbst1=-8.
variable labels dmjbst1 "First Job Status - Full or Part time".
value labels dmjbst1
1 'Full Time'
2 'Part Time'
-8 'Don t know'
-1 'Not Applicable'.
execute.

EXAMPLE: End month job one - serial='683033F' is set to 68 on end month - coding error
** amend to 6 and then amend end year to 81 having checked rest of history**

compute dmjbedm1=n4150.
if serial='683033F' dmjbedm1=6.
variable labels dmjbedm1 "End month first job since school".
value labels dmjbedm1
0 'Doing same job'
-8 'Don t know'
-1 'Not Applicable'.
execute.

Example: end year job one - serial='683033F' is set to 10 on original - coding error - as month was set to 68 - therefore will amend to 6/81
serial='720097M' was set to 10 but believe should be set to 1 – which refers to 'doing same job'

compute dmjbedy1=n4152.
if serial='683033F' dmjbedy1=81.
if serial='720097M' dmjbedy1=1.
variable labels dmjbedy1 "End year first job since school".

Note of caution for NCDS 4 occupation details:

Within this dataset there is a discrepancy for 808 cases where one job spell has dates and complete information on all the variables, but a second job spell contained only an occupation code and no dates or other information. This may have occurred in cases where a respondent had two jobs but only one set of dates were collected / coded. This Data Note does not seek to clean these cases; therefore I have provided the following syntax which will identify the 808 cases referred to.

**This syntax establishes what the 2nd job is in NCDS 4 to match with the 2nd occupation code. In computing these – the*
value 99 refers to the cases that only have one job - these are the cases of interest here.

```

freq dmj2.
```

the following picks out all 3565 cases who have one job

```
temp.
select if dmj2=99.
list serial n4147 n4156 n4165 n4174 n6121 n6138.
```

Of the 3565 cases, 1434 give an occupation code in both occupation variables – this lists them all

```
temp.
select if dmj2=99 and n6121>0 and n6138>0.
list serial n4147 n4156 n4165 n4174 n6121 n6138.
```

Of the 1434 cases - 808 cases have different occupation codes but the rest have matching occupation codes. The following temp command selects the 808 cases

```
temp.
select if dmj2=99 and n6121~=n6138.
list serial n4147 n4156 n4165 n4174 n6121 n6138.
```

APPENDIX TWO – NCDS 5 cleaning

NCDS 5 cleaning – run on NCDS 5 data only

**One of the problems with ncds 5 job spells is that not all of the dates are in the same chronological order as the majority - that means that whilst most go from most distant (earliest) to most recent job some dates actually go from most recent to most distant (earliest). This does not affect the cleaning used here and is remedied when I begin my analysis using the vector syntax. The chronological ordering of jobs could change more than once in progressing through the job spells. In the syntax which follows (at the bottom) these very complex cases are dealt with individually in order to make their job spells wholly consistent by starting from most distant job spell to most recent job spell in time.

For cleaning purposes i recode the system missing values to -1 so that i can check them correctly

().

Example of problem: - NUMBER OF PAID JOBS SINCE SCHOOL

**44 cases were set to missing and 4 of these were set to 0 (which for this variable only, refers to no jobs) but these cases have provided some work history information change 44 cases to -8 DK in this variable.
65 cases provided number of jobs but no work history details found therefore amend to 0
3 cases provided number of jobs but only start month given and no further history details therefore also amend to 0
**serial='238014R' gave a start month and year but no further information - this date coincided with unemployment spell therefore amend to -1 NA.
serial='Y01016Q' and 'Y01603F' gave no dates only job status therefore amend to -1 NA**
**serial='500437F' and '528004D' and '950119D' all answered 0 in number of jobs but actually give details of job therefore code as -8 **

compute a new variable to replace existing - new variable incorporates missing categories
