

Office for National Statistics

National Statistics Opinions Survey – Technical Report – April 2011

1. The sample

The Opinions Survey uses a random probability sample stratified by: region; the proportion of households with no car; the proportion of households where the household reference person is in the National Statistics Socio-economic Classification (NS-SEC) categories one to three; and the proportion of people who are aged over 65 years. In common with most other ONS surveys, the Royal Mail's Postcode Address File (PAF) of 'small users' is used as the frame from which the Opinions sample is drawn. The PAF sampling frame contains approximately 26 million addresses in Great Britain, excluding those that receive large quantities of mail per day. Updated every three months, it is the most up-to-date and complete address database in the UK. The Opinions sample taken from the PAF covers Great Britain, excluding the Isles of Scilly and the Scottish Highlands and Islands.

Each month 67 postal sectors are selected, with probability of selection proportionate to size. Within each sector, 30 addresses are chosen randomly giving an initial sample of 2,010 addresses each month.

One person per household is selected to answer the Opinions module questions. At the start of the interview, the interviewer determines the household composition and then he/she selects the respondent from amongst all the over-16s. This selection is performed at random using a Kish grid. The data are subsequently weighted to correct for the unequal probability of selection that this causes. The interviewers endeavour to interview the selected respondent - proxy interviews are not taken.

2. Field Work

All interviews are carried out face-to-face (except for telephone reissues) by ONS interviewers who have been trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts in the first week of the calendar month and continues for the duration of the month in question. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes up to eight calls at an address at different times of the day and week before coding the household as a non-contact. After the field period, a proportion of non-contacts and refusals are re-issued to the Telephone Unit where attempts are made to obtain an interview over a four-day period. Opinions was not reissued to the telephone unit in April due to the Census.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure that the interviews actually took place with those respondents and that responses to questions are consistent.

3. Response Rate for April 2011

Each month the sample includes some ineligible addresses. The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. These are eliminated from the set sample before response rates are calculated.

The final response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Opinions sample and may not reflect the number of cases in your data. The response rate for modules was 63 per cent (1132 responding cases). Opinions was not reissued to the telephone unit in April due to the Census.

The response rate for April was 63 per cent as shown below:

	Number	Initial sample (%)	Response rate (%)
Set Sample of Addresses	2010	100	
^{††} Ineligible Addresses	212	11	
Eligible Addresses	1798	89	
Eligible Households	1792		100
No interview – refusal	461		26
[†] Unknown Eligibility	38		2
No interview – non-contact	166		9
Interviews	1132		63

[†] Unknown eligibility also includes a proportion of unallocated cases.

^{††} Ineligible addresses also include a proportion of unallocated cases.

4. Weighting the data

Weighting factors are applied to Opinions data to correct for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent. This is accounted for in the design weight, *wta* (see 4.2). The weighting system also adjusts for some non-response bias by calibrating the Opinions sample to ONS population totals. This is integrated into the final weight variables, *indwgt* and *hhgwt* (see 4.4).

Despite the considerable efforts made by interviewers to maximize response rates, approximately 35 per cent of selected individuals decline to take part or cannot be contacted. In order to compensate for this differential non-response bias, the Opinions sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to low levels of response are assigned higher weights. For example, young males living in London tend to have a lower response rate and are therefore assigned higher than average weights.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

4.1 Using weighted data

The design weight is re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is scaled so that the weighted sample size for that sub-group is the same as the unweighted sample size.

The final supplied weights should be used in your statistical analyses to produce estimates from the survey. Some statistical packages will properly account for the weighting and other complex sample design features in statistical tests. However where these are not available, some analysts will use simpler, approximate tests. It is important when doing so to make use of actual sample sizes, rather than weighted (grossed) sample sizes in such tests, or the test will act as if the sample was the size of the population and all comparisons will become apparently significant.

4.2 Calculation of the design weight

i. Unit of Analysis: Individual (Weight A (wta))

The Opinions' sampling methodology selects 2010 households from across the UK and from each household selects one person using a Kish grid. In households with only one or two adults, the likelihood of selection is greater than for adults living in households containing many adults. *Weight A* controls for this feature of the sample design by compensating for the unequal probability of selection. It is calculated by dividing the number of adults in the sampled household by the average number of adults per household.

ii. Unit of Analysis: Household (do not weight data)

On occasions a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case no design weight is required because the information is collected from every household in the responding sample.

4.3 Calibrating the Opinions Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The method uses a standard calibration approach that produces weights which adjust to more than one margin.

4.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. Unit of Analysis: Individual (indwgt)

The final individual weight (*indwgt*) is the product of the individual calibration factor (which is produced to represent the ONS population totals) and the rescaled design weight (*wta*) (that is the product of *wta* and the population total for adults divided by the number of respondents).

ii. Unit of Analysis: Household (hhwgt) (variable provided on request)

The final household weight (*hhwgt*) is the product of the household calibration factor and the household, rescaled design weight. Ideally this design weight would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weight (*wta*) and the final weight (*indwgt*) are supplied in each survey month.

Comment [L1]: The rescaling business is something we do before calibration as an input to GES.

5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Opinions Survey is 84 per cent to 86 per cent of the actual sample of individuals, when *Weight A* is applied. An achieved sample of 1800 individual adults in the Opinions Survey is equivalent to an equal probability sample of about 1500.

6. Conclusion

The Opinions Survey uses a probability based sample which is recognised as a robust method for collecting reliable data. This report and the accompanying documents are designed to provide everything necessary to use and report on your data with confidence. However, we welcome any further queries you may have and are always interested in seeing any papers or publications resulting from the survey.

National Statistics Opinions Survey – Technical Report – June 2011

1. The sample

The Opinions Survey uses a random probability sample stratified by: region; the proportion of households with no car; the proportion of households where the household reference person is in the National Statistics Socio-economic Classification (NS-SEC) categories one to three; and the proportion of people who are aged over 65 years. In common with most other ONS surveys, the Royal Mail's Postcode Address File (PAF) of 'small users' is used as the frame from which the Opinions sample is drawn. The PAF sampling frame contains approximately 26 million addresses in Great Britain, excluding those that receive large quantities of mail per day. Updated every three months, it is the most up-to-date and complete address database in the UK. The Opinions sample taken from the PAF covers Great Britain, excluding the Isles of Scilly and the Scottish Highlands and Islands.

Each month 67 postal sectors are selected, with probability of selection proportionate to size. Within each sector, 30 addresses are chosen randomly giving an initial sample of 2,010 addresses each month.

One person per household is selected to answer the Opinions module questions. At the start of the interview, the interviewer determines the household composition and then he/she selects the respondent from amongst all the over-16s. This selection is performed at random using a Kish grid. The data are subsequently weighted to correct for the unequal probability of selection that this causes. The interviewers endeavour to interview the selected respondent - proxy interviews are not taken.

2. Field Work

All interviews are carried out face-to-face (except for telephone reissues) by ONS interviewers who have been trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts in the first week of the calendar month and continues for the duration of the month in question. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes up to eight calls at an address at different times of the day and week before coding the household as a non-contact. After the field period, a proportion of non-contacts and refusals are re-issued to the Telephone Unit where attempts are made to obtain an interview over a four-day period.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure that the interviews actually took place with those respondents and that responses to questions are consistent.

3. Response Rate for June 2011

Each month the sample includes some ineligible addresses. The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. These are eliminated from the set sample before response rates are calculated.

The final response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Opinions sample and may not reflect the number of cases in your data. The response rate for modules was 66 per cent (1192 responding cases).

The response rate for June after reissues was 66 per cent as shown below:

	Number	Initial sample (%)	Response rate (%)
Set Sample of Addresses	2010	100	
†† Ineligible Addresses	172	9	
Eligible Addresses	1835	91	
Eligible Households	1800		100
No interview – refusal	477		27
† Unknown Eligibility	26		1
No interview – non-contact	101		6
Interviews	1196		66

† Unknown eligibility also includes a proportion of unallocated cases.

†† Ineligible addresses also include a proportion of unallocated cases.

4. Weighting the data

Weighting factors are applied to Opinions data to correct for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent. This is accounted for in the design weight, *wta* (see 4.2). The weighting system also adjusts for some non-response bias by calibrating the Opinions sample to ONS population totals. This is integrated into the final weight variables, *indwgt* and *hhgwt* (see 4.4).

Despite the considerable efforts made by interviewers to maximize response rates, approximately 35 per cent of selected individuals decline to take part or cannot be contacted. In order to compensate for this differential non-response bias, the Opinions sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to low levels of response are assigned higher weights. For example, young males

living in London tend to have a lower response rate and are therefore assigned higher than average weights.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

4.1 Using weighted data

The design weight is re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is scaled so that the weighted sample size for that sub-group is the same as the unweighted sample size.

The final supplied weights should be used in your statistical analyses to produce estimates from the survey. Some statistical packages will properly account for the weighting and other complex sample design features in statistical tests. However where these are not available, some analysts will use simpler, approximate tests. It is important when doing so to make use of actual sample sizes, rather than weighted (grossed) sample sizes in such tests, or the test will act as if the sample was the size of the population and all comparisons will become apparently significant.

4.2 Calculation of the design weight

i. Unit of Analysis: Individual (Weight A (wta))

The Opinions' sampling methodology selects 2010 households from across the UK and from each household selects one person using a Kish grid. In households with only one or two adults, the likelihood of selection is greater than for adults living in households containing many adults. *Weight A* controls for this feature of the sample design by compensating for the unequal probability of selection. It is calculated by dividing the number of adults in the sampled household by the average number of adults per household.

ii. Unit of Analysis: Household (do not weight data)

On occasions a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case no design weight is required because the information is collected from every household in the responding sample.

4.3 Calibrating the Opinions Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The method uses a standard calibration approach that produces weights which adjust to more than one margin.

4.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. Unit of Analysis: Individual (indwgt)

The final individual weight (*indwgt*) is the product of the individual calibration factor (which is produced to represent the ONS population totals) and the rescaled design weight (*wta*) (that is the product of *wta* and the population total for adults divided by the number of respondents).

ii. Unit of Analysis: Household (hhwgt) (variable provided on request)

The final household weight (*hhwgt*) is the product of the household calibration factor and the household, rescaled design weight. Ideally this design weight would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weight (*wta*) and the final weight (*indwgt*) are supplied in each survey month.

Comment [L1]: The rescaling business is something we do before calibration as an input to GES.

5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Opinions Survey is 84 per cent to 86 per cent of the actual sample of individuals, when *Weight A* is applied. An achieved sample of 1800 individual adults in the Opinions Survey is equivalent to an equal probability sample of about 1500.

6. Conclusion

The Opinions Survey uses a probability based sample which is recognised as a robust method for collecting reliable data. This report and the accompanying documents are designed to provide everything necessary to use and report on your data with confidence. However, we welcome any further queries you may have and are always interested in seeing any papers or publications resulting from the survey.

National Statistics Opinions Survey – Technical Report – July 2011

1. The sample

The Opinions Survey uses a random probability sample stratified by: region; the proportion of households with no car; the proportion of households where the household reference person is in the National Statistics Socio-economic Classification (NS-SEC) categories one to three; and the proportion of people who are aged over 65 years. In common with most other ONS surveys, the Royal Mail's Postcode Address File (PAF) of 'small users' is used as the frame from which the Opinions sample is drawn. The PAF sampling frame contains approximately 26 million addresses in Great Britain, excluding those that receive large quantities of mail per day. Updated every three months, it is the most up-to-date and complete address database in the UK. The Opinions sample taken from the PAF covers Great Britain, excluding the Isles of Scilly and the Scottish Highlands and Islands.

Each month 67 postal sectors are selected, with probability of selection proportionate to size. Within each sector, 30 addresses are chosen randomly giving an initial sample of 2,010 addresses each month.

One person per household is selected to answer the Opinions module questions. At the start of the interview, the interviewer determines the household composition and then he/she selects the respondent from amongst all the over-16s. This selection is performed at random using a Kish grid. The data are subsequently weighted to correct for the unequal probability of selection that this causes. The interviewers endeavour to interview the selected respondent - proxy interviews are not taken.

2. Field Work

All interviews are carried out face-to-face (except for telephone reissues) by ONS interviewers who have been trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts in the first week of the calendar month and continues for the duration of the month in question. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes up to eight calls at an address at different times of the day and week before coding the household as a non-contact.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure that the interviews actually took place with those respondents and that responses to questions are consistent.

3. Response Rate for July 2011

Each month the sample includes some ineligible addresses. The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. These are eliminated from the set sample before response rates are calculated.

The final response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Opinions sample and may not reflect the number of cases in your data. The response rate for modules was 64 per cent (1161 responding cases).

The response rate for July was 64 per cent as shown below:

	Number	Initial sample (%)	Response rate (%)
Set Sample of Addresses	2010	100	
†† Ineligible Addresses	185	9	
Eligible Addresses	1825	91	
Eligible Households	1813		100
No interview – refusal	485		27
† Unknown Eligibility	5		0
No interview – non-contact	170		9
Interviews	1153		64

† Unknown eligibility also includes a proportion of unallocated cases.

†† Ineligible addresses also include a proportion of unallocated cases.

4. Weighting the data

Weighting factors are applied to Opinions data to correct for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent. This is accounted for in the design weight, *wta* (see 4.2). The weighting system also adjusts for some non-response bias by calibrating the Opinions sample to ONS population totals. This is integrated into the final weight variables, *indwgt* and *hhgwt* (see 4.4).

Despite the considerable efforts made by interviewers to maximize response rates, approximately 35 per cent of selected individuals decline to take part or cannot be contacted. In order to compensate for this differential non-response bias, the Opinions sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to low levels of response are assigned higher weights. For example, young males

living in London tend to have a lower response rate and are therefore assigned higher than average weights.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

4.1 Using weighted data

The design weight is re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is scaled so that the weighted sample size for that sub-group is the same as the unweighted sample size.

The final supplied weights should be used in your statistical analyses to produce estimates from the survey. Some statistical packages will properly account for the weighting and other complex sample design features in statistical tests. However where these are not available, some analysts will use simpler, approximate tests. It is important when doing so to make use of actual sample sizes, rather than weighted (grossed) sample sizes in such tests, or the test will act as if the sample was the size of the population and all comparisons will become apparently significant.

4.2 Calculation of the design weight

i. Unit of Analysis: Individual (Weight A (wta))

The Opinions' sampling methodology selects 2010 households from across the UK and from each household selects one person using a Kish grid. In households with only one or two adults, the likelihood of selection is greater than for adults living in households containing many adults. *Weight A* controls for this feature of the sample design by compensating for the unequal probability of selection. It is calculated by dividing the number of adults in the sampled household by the average number of adults per household.

ii. Unit of Analysis: Household (do not weight data)

On occasions a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case no design weight is required because the information is collected from every household in the responding sample.

4.3 Calibrating the Opinions Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The method uses a standard calibration approach that produces weights which adjust to more than one margin.

4.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. Unit of Analysis: Individual (indwgt)

The final individual weight (*indwgt*) is the product of the individual calibration factor (which is produced to represent the ONS population totals) and the rescaled design weight (*wta*) (that is the product of *wta* and the population total for adults divided by the number of respondents).

ii. Unit of Analysis: Household (hhwgt) (variable provided on request)

The final household weight (*hhwgt*) is the product of the household calibration factor and the household, rescaled design weight. Ideally this design weight would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weight (*wta*) and the final weight (*indwgt*) are supplied in each survey month.

Comment [L1]: The rescaling business is something we do before calibration as an input to GES.

5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Opinions Survey is 84 per cent to 86 per cent of the actual sample of individuals, when *Weight A* is applied. An achieved sample of 1800 individual adults in the Opinions Survey is equivalent to an equal probability sample of about 1500.

6. Conclusion

The Opinions Survey uses a probability based sample which is recognised as a robust method for collecting reliable data. This report and the accompanying documents are designed to provide everything necessary to use and report on your data with confidence. However, we welcome any further queries you may have and are always interested in seeing any papers or publications resulting from the survey.

National Statistics Opinions Survey – Technical Report – August 2011

1. The sample

The Opinions Survey uses a random probability sample stratified by: region; the proportion of households with no car; the proportion of households where the household reference person is in the National Statistics Socio-economic Classification (NS-SEC) categories one to three; and the proportion of people who are aged over 65 years. In common with most other ONS surveys, the Royal Mail's Postcode Address File (PAF) of 'small users' is used as the frame from which the Opinions sample is drawn. The PAF sampling frame contains approximately 26 million addresses in Great Britain, excluding those that receive large quantities of mail per day. Updated every three months, it is the most up-to-date and complete address database in the UK. The Opinions sample taken from the PAF covers Great Britain, excluding the Isles of Scilly and the Scottish Highlands and Islands.

Each month 67 postal sectors are selected, with probability of selection proportionate to size. Within each sector, 30 addresses are chosen randomly giving an initial sample of 2,010 addresses each month.

One person per household is selected to answer the Opinions module questions. At the start of the interview, the interviewer determines the household composition and then he/she selects the respondent from amongst all the over-16s. This selection is performed at random using a Kish grid. The data are subsequently weighted to correct for the unequal probability of selection that this causes. The interviewers endeavour to interview the selected respondent - proxy interviews are not taken.

2. Field Work

All interviews are carried out face-to-face (except for telephone reissues) by ONS interviewers who have been trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts in the first week of the calendar month and continues for the duration of the month in question. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes up to eight calls at an address at different times of the day and week before coding the household as a non-contact.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure that the interviews actually took place with those respondents and that responses to questions are consistent.

3. Response Rate for August 2011

Each month the sample includes some ineligible addresses. The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. These are eliminated from the set sample before response rates are calculated.

The final response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Opinions sample and may not reflect the number of cases in your data. The response rate for modules was 63 per cent (1137 responding cases).

The response rate for August was 63 per cent as shown below:

	Number	Initial sample (%)	Response rate (%)
Set Sample of Addresses	2010	100	
†† Ineligible Addresses	170	8	
Eligible Addresses	1840	92	
Eligible Households	1840		100
No interview – refusal	529		29
† Unknown Eligibility	0		0
No interview – non-contact	140		8
Interviews	1171		64

† Unknown eligibility also includes a proportion of unallocated cases.

†† Ineligible addresses also include a proportion of unallocated cases.

4. Weighting the data

Weighting factors are applied to Opinions data to correct for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent. This is accounted for in the design weight, *wta* (see 4.2). The weighting system also adjusts for some non-response bias by calibrating the Opinions sample to ONS population totals. This is integrated into the final weight variables, *indwgt* and *hhgwt* (see 4.4).

Despite the considerable efforts made by interviewers to maximize response rates, approximately 35 per cent of selected individuals decline to take part or cannot be contacted. In order to compensate for this differential non-response bias, the Opinions sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to low levels of response are assigned higher weights. For example, young males

living in London tend to have a lower response rate and are therefore assigned higher than average weights.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

4.1 Using weighted data

The design weight is re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is scaled so that the weighted sample size for that sub-group is the same as the unweighted sample size.

The final supplied weights should be used in your statistical analyses to produce estimates from the survey. Some statistical packages will properly account for the weighting and other complex sample design features in statistical tests. However where these are not available, some analysts will use simpler, approximate tests. It is important when doing so to make use of actual sample sizes, rather than weighted (grossed) sample sizes in such tests, or the test will act as if the sample was the size of the population and all comparisons will become apparently significant.

4.2 Calculation of the design weight

i. Unit of Analysis: Individual (Weight A (wta))

The Opinions' sampling methodology selects 2010 households from across the UK and from each household selects one person using a Kish grid. In households with only one or two adults, the likelihood of selection is greater than for adults living in households containing many adults. *Weight A* controls for this feature of the sample design by compensating for the unequal probability of selection. It is calculated by dividing the number of adults in the sampled household by the average number of adults per household.

ii. Unit of Analysis: Household (do not weight data)

On occasions a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case no design weight is required because the information is collected from every household in the responding sample.

4.3 Calibrating the Opinions Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The method uses a standard calibration approach that produces weights which adjust to more than one margin.

4.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. Unit of Analysis: Individual (indwgt)

The final individual weight (*indwgt*) is the product of the individual calibration factor (which is produced to represent the ONS population totals) and the rescaled design weight (*wta*) (that is the product of *wta* and the population total for adults divided by the number of respondents).

ii. Unit of Analysis: Household (hhwgt) (variable provided on request)

The final household weight (*hhwgt*) is the product of the household calibration factor and the household, rescaled design weight. Ideally this design weight would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weight (*wta*) and the final weight (*indwgt*) are supplied in each survey month.

Comment [L1]: The rescaling business is something we do before calibration as an input to GES.

5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Opinions Survey is 84 per cent to 86 per cent of the actual sample of individuals, when *Weight A* is applied. An achieved sample of 1800 individual adults in the Opinions Survey is equivalent to an equal probability sample of about 1500.

6. Conclusion

The Opinions Survey uses a probability based sample which is recognised as a robust method for collecting reliable data. This report and the accompanying documents are designed to provide everything necessary to use and report on your data with confidence. However, we welcome any further queries you may have and are always interested in seeing any papers or publications resulting from the survey.

Office for National Statistics

National Statistics Opinions Survey – Technical Report – September 2011

1. The sample

The Opinions Survey uses a random probability sample stratified by: region; the proportion of households with no car; the proportion of households where the household reference person is in the National Statistics Socio-economic Classification (NS-SEC) categories one to three; and the proportion of people who are aged over 65 years. In common with most other ONS surveys, the Royal Mail's Postcode Address File (PAF) of 'small users' is used as the frame from which the Opinions sample is drawn. The PAF sampling frame contains approximately 26 million addresses in Great Britain, excluding those that receive large quantities of mail per day. Updated every three months, it is the most up-to-date and complete address database in the UK. The Opinions sample taken from the PAF covers Great Britain, excluding the Isles of Scilly and the Scottish Highlands and Islands.

Each month 67 postal sectors are selected, with probability of selection proportionate to size. Within each sector, 30 addresses are chosen randomly giving an initial sample of 2,010 addresses each month.

One person per household is selected to answer the Opinions module questions. At the start of the interview, the interviewer determines the household composition and then he/she selects the respondent from amongst all the over-16s. This selection is performed at random using a Kish grid. The data are subsequently weighted to correct for the unequal probability of selection that this causes. The interviewers endeavour to interview the selected respondent - proxy interviews are not taken.

2. Field Work

All interviews are carried out face-to-face (except for telephone reissues) by ONS interviewers who have been trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts in the first week of the calendar month and continues for the duration of the month in question. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes up to eight calls at an address at different times of the day and week before coding the household as a non-contact.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure

that the interviews actually took place with those respondents and that responses to questions are consistent.

3. Response Rate for September 2011

Each month the sample includes some ineligible addresses. The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. These are eliminated from the set sample before response rates are calculated.

The final response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Opinions sample and may not reflect the number of cases in your data. The response rate for modules was 61 per cent (1117 responding cases).

The response rate for September was 61 per cent as shown below:

	Number	Initial sample (%)	Response rate (%)
Set Sample of Addresses	2010	100	
^{††} Ineligible Addresses	188	9	
Eligible Addresses	1822	91	
Eligible Households	1821		100
No interview – refusal	543		30
[†] Unknown Eligibility	5		0
No interview – non-contact	156		9
Interviews	1117		61

[†] Unknown eligibility also includes a proportion of unallocated cases.

^{††} Ineligible addresses also include a proportion of unallocated cases.

4. Weighting the data

Weighting factors are applied to Opinions data to correct for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent. This is accounted for in the design weight, *wta* (see 4.2). The weighting system also adjusts for some non-response bias by calibrating the Opinions sample to ONS population totals. This is integrated into the final weight variables, *indwgt* and *hhgwt* (see 4.4).

Despite the considerable efforts made by interviewers to maximize response rates, approximately 35 per cent of selected individuals decline to take part or cannot be contacted. In order to compensate for this differential non-response bias, the Opinions sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to low levels of response are assigned higher weights. For example, young males living in London tend to have a lower response rate and are therefore assigned higher than average weights.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

4.1 Using weighted data

The design weight is re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is scaled so that the weighted sample size for that sub-group is the same as the unweighted sample size.

The final supplied weights should be used in your statistical analyses to produce estimates from the survey. Some statistical packages will properly account for the weighting and other complex sample design features in statistical tests. However where these are not available, some analysts will use simpler, approximate tests. It is important when doing so to make use of actual sample sizes, rather than weighted (grossed) sample sizes in such tests, or the test will act as if the sample was the size of the population and all comparisons will become apparently significant.

4.2 Calculation of the design weight

i. Unit of Analysis: Individual (Weight A (wta))

The Opinions' sampling methodology selects 2010 households from across the UK and from each household selects one person using a Kish grid. In households with only one or two adults, the likelihood of selection is greater than for adults living in households containing many adults. *Weight A* controls for this feature of the sample design by compensating for the unequal probability of selection. It is calculated by dividing the number of adults in the sampled household by the average number of adults per household.

ii. Unit of Analysis: Household (do not weight data)

On occasions a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case no design weight is required because the information is collected from every household in the responding sample.

4.3 Calibrating the Opinions Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The method uses a standard calibration approach that produces weights which adjust to more than one margin.

4.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. Unit of Analysis: Individual (indwgt)

The final individual weight (*indwgt*) is the product of the individual calibration factor (which is produced to represent the ONS population totals) and the rescaled design weight (*wta*) (that is the product of *wta* and the population total for adults divided by the number of respondents).

ii. Unit of Analysis: Household (hhwgt) (variable provided on request)

The final household weight (*hhwgt*) is the product of the household calibration factor and the household, rescaled design weight. Ideally this design weight would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weight (*wta*) and the final weight (*indwgt*) are supplied in each survey month.

Comment [L1]: The rescaling business is something we do before calibration as an input to GES.

5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Opinions Survey is 84 per cent to 86 per cent of the actual sample of individuals, when *Weight A* is applied. An achieved sample of 1800 individual adults in the Opinions Survey is equivalent to an equal probability sample of about 1500.

6. Conclusion

The Opinions Survey uses a probability based sample which is recognised as a robust method for collecting reliable data. This report and the accompanying documents are designed to provide everything necessary to use and report on your data with confidence. However, we welcome any further queries you may have and are always interested in seeing any papers or publications resulting from the survey.

National Statistics Opinions Survey

MODULE INSTRUCTIONS

April 2011

Cycle 04/11

The Opinions Survey is only asked of the respondent selected using the Kish grid. Some modules may apply only to certain sections of the population. Check the 'addressed to whom' column for further details.

Module	Title	Addressed to whom	Estimated Average Duration
01	Classificatory Questions	All	12
MCZ	Wellbeing	All	4

Time allowances (based on a full quota of 30 addresses)

The Opinions Survey runs to a tight timetable. The individual times given above for individual modules are intended as a rough guide. You should run through the questionnaire using training cases before starting fieldwork.

If you experience difficulties with the times allowed, contact the Field Office via the Field Enquiry Line without delay.

You should claim the actual time spent **up to** these maxima.

- 8 days (48 hours) England, Scotland and Wales within sampled area – excludes travel time to area (4 days (24 hours) for half quotas)
- Up to 3 hours to read the Standard Instruction Manual, Opinions Module and the Opinions Survey Annual Field Interviewer Instructions 2010. (*The Standard Instruction Manual and Opinions Annual Instructions may only be claimed once on your first Opinions quota in the survey year.*)
- Up to 1½ hours to read these monthly instructions and work through training cases.
- Up to 2 hours to prepare for your quota.

NOTE: If an Interpreter is used then please specify if this interpreter was a professional ONS interpreter, if the interpreter was the interviewer or if the interpreter was a family member or friend.

Classificatory Questions

These questions are standard and are asked on the Opinions Survey each month. They are similar to the questions asked on the CPS, but shorter in length.

Opinions survey specific information

The Opinions Survey is not part of the CPS. Therefore, a number of the classificatory questions in the CPS are not on this survey. For the Opinions survey it is only necessary to interview the selected respondent, that is the individual selected using the Kish grid. Basic information on all household members must be taken to determine who the selected respondent is.

Client: Office for National Statistics

Target Group: All

Opinion Questions: All

Split Sample:

ONS is assessing best practice for delivering these questions. The module uses a split sample method – addresses 1-15 are asked all questions by the interviewer using a showcard, addresses 16-30 self complete all questions on the laptop (except if delivered by the telephone unit). There are no practice questions for respondents completing using the laptop.

All questions ask respondents to rate their wellbeing on a 0-10 scale where 0 is always low and 10 high.

MCZ_1 to 4 These are subjective wellbeing questions which are also running on the IHS.

MCZ_5a - 5g Subjective wellbeing questions asking about different domains of peoples' lives.

MCZ_5h Asked only to parents with dependent children living at home. Asks parents to rate the wellbeing of their children.

Selfend Asks people self completing to return the laptop to the interviewer.

Please remember to enter any comments you have on this module in the MintCom section

National Statistics Opinions Survey

MODULE INSTRUCTIONS

June 2011

Cycle 06/11

The Opinions Survey is only asked of the respondent selected using the Kish grid. Some modules may apply only to certain sections of the population. Check the 'addressed to whom' column for further details.

Module	Title	Addressed to whom	Estimated Average Duration
01	Classificatory Questions	All	12
MCZ	Wellbeing	All	5

Time allowances (based on a full quota of 30 addresses)

The Opinions Survey runs to a tight timetable. The individual times given above for individual modules are intended as a rough guide. You should run through the questionnaire using training cases before starting fieldwork.

If you experience difficulties with the times allowed, contact the Field Office via the Field Enquiry Line without delay.

You should claim the *actual* time spent **up to** these maxima.

- 8 days (48 hours) England, Scotland and Wales within sampled area – excludes travel time to area (4 days (24 hours) for half quotas)
- Up to 3 hours to read the Standard Instruction Manual, Opinions Module and the Opinions Survey Annual Field Interviewer Instructions 2010. (*The Standard Instruction Manual and Opinions Annual Instructions may only be claimed once on your first Opinions quota in the survey year.*)
- Up to 1½ hours to read these monthly instructions and work through training cases.
- Up to 2 hours to prepare for your quota.

Classificatory Questions

01

Classificatory Questions

These questions are standard and are asked on the Opinions Survey each month. They are similar to the questions asked on the CPS, but shorter in length.

Opinions survey specific information

The Opinions Survey is not part of the CPS. Therefore, a number of the classificatory questions in the CPS are not on this survey. For the Opinions survey it is only necessary to interview the selected respondent, that is the individual selected using the Kish grid. Basic information on all household members must be taken to determine who the selected respondent is.

Client: Office for National Statistics

Target Group: All

Opinion Questions: All

Split Sample:

ONS is measuring the impact of delivering these questions via self completion or interviewer administered questions. The module uses a split sample method – addresses 1-7 and 15-23 are asked all questions by the interviewer. Addresses 8-14 and 24-30 self complete all questions on the laptop (except if delivered by the telephone unit).

PLEASE DO NOT COMPLETE THE SELF COMPLETION QUESTIONS YOURSELF, IF THE RESPONDENT IS UNABLE TO USE THE COMPUTER, PLEASE SKIP THE MODULE OR REFUSE ALL QUESTIONS.

All questions ask respondents to rate their wellbeing on a 0-10 scale where 0 is generally low and 10 high.

Introx Half of the sample will be asked to complete questions themselves on the computer. This introduction allows the interviewer to skip the module if the respondent is unable to self complete. If the module is started and the respondent doesn't want to continue answering questions themselves, please refuse outstanding questions and add a remark to this effect.

MCZ_1 to 4 These are subjective wellbeing questions which are also running on the IHS.

MCZ_5a - 5g Subjective wellbeing questions asking about different domains of peoples' lives.

MCZ_5h Asked only to parents with dependent children living at home. Asks parents to rate the wellbeing of their children.

MCZ_6a and MCZ_6b These questions are randomised so that respondents will either be asked about satisfaction with life one or five years ago.

MCZ_7a and MCZ_7b These questions are randomised so that respondents will either be asked about how optimistic they feel about their lives in relation to one or five years.

MCZ_8a MCZ_8b Asks 'Cantrill's ladder' questions on well being.

MCZ_9 Asks those in employment how satisfied they are with their work life balance.

Selfend Asks people self completing to return the laptop to the interviewer.

Please remember to enter any comments you have on this module in the MintCom section

National Statistics Opinions Survey

MODULE INSTRUCTIONS

July 2011

Cycle 07/11

The Opinions Survey is only asked of the respondent selected using the Kish grid. Some modules may apply only to certain sections of the population. Check the 'addressed to whom' column for further details.

Module	Title	Addressed to whom	Estimated Average Duration
01	Classificatory Questions	All	12
MCZ	Wellbeing	All	5

Time allowances (based on a full quota of 30 addresses)

The Opinions Survey runs to a tight timetable. The individual times given above for individual modules are intended as a rough guide. You should run through the questionnaire using training cases before starting fieldwork.

Client: Office for National Statistics

Target Group: All

Opinion Questions: MCZ_1 to MCZ_21

Split Sample:

ONS is measuring the impact of the order of the first 4 subjective wellbeing questions (MCZ_1 to MCZ_4). These questions are randomised so that respondents will be asked the first 4 questions in 1 of 4 different orders:

Addresses 1-7: MCZ_1, MCZ_2, MCZ_3, MCZ_4

Addresses 8-15: MCZ_1, MCZ_3, MCZ_4, MCZ_2

Addresses 16-22: MCZ_3, MCZ_4, MCZ_1, MCZ_2

Addresses 23-30: MCZ_1, MCZ_2, MCZ_4, MCZ_3

Questions MCZ_1- MCZ_20 ask respondents to rate their wellbeing on a 0-10 scale where 0 is generally low and 10 high.

MCZ_1 to 4 These are subjective wellbeing questions which are also running on the IHS. These questions are randomised so that respondents will be asked the 4 questions in 1 of 4 different orders.

MCZ_5 - 7 Subjective wellbeing questions asking about different area of peoples' lives.

MCZ_8 - 15 Subjective wellbeing questions asking about the local area where the respondent lives. When answering these questions the respondent should consider the local area to be the area within 15-20 minutes walking distance from their home.

MCZ_16a – 16f Subjective wellbeing questions asking about the quality of public services in this country. It is up to the respondent what they consider 'this country' to mean when answering these questions.

MCZ_17a-17d Subjective wellbeing questions asking about how much the respondent personally trusts different institutions in this country. It is up to the respondent what they consider 'this country' to mean when answering these questions.

MCZ_18-20 Subjective wellbeing questions asking about different aspects of this country. It is up to the respondent what they consider 'this country' to mean when answering these questions.

MCZ_21 Asks respondents if they think the overall situation of this country will get better, stay the same, or get worse? (please note that unlike all previous MCZ questions, this is not an 11 point scale)

MCZ_22 Ask respondents about which country or countries they were thinking about when answering questions MCZ_16a-MCZ_21. There are no right or wrong answers. Respondents may have been thinking of different countries for different questions. We are interested in all countries that respondents were thinking about when answering the previous questions. Code all that apply.

MCZ_spec22 Asks interviewer to specify any 'Other' countries that are given in MCZ_22.

Please remember to enter any comments you have on this module in the MintCom section

(QSignIn.IntrType = Tel)

Intro1

The following questions are about wellbeing and are asked on behalf of the Office for National Statistics.

I would like to ask you four questions about your feelings on aspects of your life. There are no right or wrong answers. For each of these questions I'd like you to give an answer on a scale of nought to 10, where nought is 'not at all' and 10 is 'completely'.

Please answer the next questions using the laptop. Read each question and follow the instructions on the screen. Please ask me if you need any help in using the laptop.

Interviewer, please hand the laptop to the respondent

Intro1

The following questions are about wellbeing and are asked on behalf of the Office for National Statistics.

I would like to ask you four questions about your feelings on aspects of your life. There are no right or wrong answers. For each of these questions I'd like you to give an answer on a scale of nought to 10, where nought is 'not at all' and 10 is 'completely'.

(1) Press <1> to continue

ASK IF: DMHSIZE >= 1
AND: NOT ((QID.Address >= 16) AND (QID.Address < 31)) AND NOT

IntroS2

i@|ONS is measuring the difference in responses between self completed and interviewer administered questions. The next questions require the respondent to use the computer. It is important to collect this data, but if the respondent is unable to self complete, please skip the next 19 questions using option two below or refuse all questions throughout the module.

Do not ask the questions yourself.

- (1) Proceed to self completion
 - (2) Skip self completion questions
-

ASK IF: DMHSIZE >= 1
AND: NOT ((QID.Address >= 1) AND (QID.Address <= 15))
AND: ((QID.Address >= 16) AND (QID.Address <= 30)) AND NOT
(QSignIn.IntrType = Tel)
AND: IntroS2 = Continue

Intro2S2

Next I would like to ask you four questions about your feelings on aspects of your life. There are no right or wrong answers. For each of these questions I'd like you to give an answer on a scale of nought to 10, where nought is 'not at all' and 10 is 'completely'.

Please answer the next questions using the laptop. Read each question and follow the instructions on the screen. Please ask me if you need any help in using the laptop.

Interviewer, do not complete these questions yourself. If the respondent is unable to self complete, please refuse all remaining questions.

Please hand the laptop to the respondent.
