1. INTRODUCTION

Understanding Society: the UK Household Longitudinal Study (UKHLS) draws heavily on the success of its predecessor, the British Household Panel Survey (BHPS). The BHPS is a longitudinal social survey of households and individuals living in the UK. It started in 1991 with 5,000 households selected at random within Great Britain. In 1999, an additional 1,500 households were added in each of Scotland and Wales and in 2000, an additional 2,000 households were added in Northern Ireland. Data collection under the umbrella of the BHPS study title stopped in the year *Understanding Society* started (2009). Many design features, instruments, and questions from the BHPS live on in *Understanding Society* and data collection from eligible BHPS sample members continues as part of *Understanding Society*, offering opportunities to exploit data from the two studies jointly to create a long panel of data. There are, however, some structural differences between the two studies, such as separate study documentations, not identical data structures, naming conventions and identifiers. These differences present complexities for researchers wishing to use the two studies together.

The ‘*Understanding Society* harmonised BHPS’ project (henceforward: harmonised BHPS) started in 2016, led by Laura Fumagalli and Nick Buck. The overall objective is to facilitate and encourage the combined use of *Understanding Society* and BHPS by overcoming actual and perceived barriers. The project aim is to produce a fully combined version of BHPS data from Wave 1 to 18 with *Understanding Society* data from Wave 1 onwards. The combined data will be updated and released jointly as part of *Understanding Society* in the future. With the *Understanding Society* Wave 1-7 data we present the result of the first phase of a more comprehensive project.

The project makes it possible to use the BHPS in conjunction with *Understanding Society* (and *vice versa*). This was also possible in the past, but it was an error-prone process requiring significant effort. We removed four main hurdles. First, we harmonised naming conventions, such that files pertaining to BHPS and *Understanding Society* can now be appended, merged and used together with very minimal recoding required. Second, we identified “spurious matches”, i.e. cases of variables with the same name in the two studies, but different content, and we made sure users do not erroneously treat them as the same variables. Third, we identified cases where the same information was present in the two studies under different forms (e.g., under different variable names). In this case, we renamed, recoded and combined existing BHPS variables to match the *Understanding Society* equivalent. Fourth, we harmonised the cross-wave information in *xwavedat*.

As a result of this effort around a fifth of the variables in the individual response data file (**indresp**) of the harmonised BHPS are harmonised, i.e., they have a non-spurious match in *Understanding Society*. The respective shares of harmonised variables in other files are 23 per cent in the young person response data file (**youth**), around 27 per cent in the case of the individual enumeration data file (**indall**) and 31 per cent in the case of the household response data file (**hhresp**). Note that none of these matches are spurious, and thus variables with the same name now measure the same construct. Finally, users can now find all the cross-wave information for all BHPS and *Understanding Society* sample members in a single file (**xwavedat**).

The documentation has also been harmonised. The *Understanding Society* online data documentation now covers the harmonised BHPS, as well as the *Understanding Society* data. The stand-alone BHPS questionnaires have been included, but these documents have not been updated to reflect the new variable names in the harmonised BHPS. Users will need to consult the online documentation for information about the treatment of specific variables.

Data harmonisation is a challenging process. Although significant efforts have been made to achieve the highest data quality, it can still be possible that variables with the same name, within or across studies, are derived through slightly different question wording or code frame. For example, the code frame for the employment status variable *jbstat* changed over time in both studies. Analysts should always check the questionnaires, frequencies and labels of any data they want to analyse.

This project wouldn't have been possible without the support of data users. We are grateful to a range of beta users who tested and fed back on an earlier version of this file. Future phases will expand the range of variables harmonised. We would welcome suggestions and code from users for areas that could be harmonised further.

1.1. HOW TO NAVIGATE THIS USER GUIDE

The *Understanding Society* harmonised BHPS User Guide accompanies the first edition of the *Understanding Society*-harmonised BHPS, released as part of the *Understanding Society* data series. It supplements the *Understanding Society* Wave 1-7 User Guide ([Knies 2017](#)) and the stand-alone BHPS Wave 1-18 User Guide Volume A ([Taylor 2010](#)). The focus is on the harmonisation process for the BHPS data. We do not cover any structural differences in scope, fieldwork practices, questionnaire design and content of the two studies. Analysts should refer to the respective Study's stand-alone user guide for this information and evaluate how the differences may affect the results of their analysis. Table 1 lists specific sections of the stand-alone user guides.

Table 1: Signposting of User Guide Sections

	BHPS Volume A documentation	UKHLS User Guide	Harmonised BHPS
Introduction	A2-2 – A2-3	1	1
Data structure	A2-11	3.1	2.3
Unique identifiers	A3-9	3.2.4	2.3.2.1
Variable naming conventions	A3-13	3.2.2	2.2 and 2.3.2
Missing values	A3-15	3.2.3	2.3.3.1
Sampling	A4-1 – A4-5	2.2	See BHPS and UKHLS guides.
Data collection methods	A4-6 – A4-13, A4-20 – A4-23	2.3	See BHPS and UKHLS guides
Weighting	A5-1 – A5-12	3.9	2.3.2.5
Imputation	A5-22 – A5-24	3.10	See BHPS and UKHLS guides.
Accessing the data	A6-1	4	2

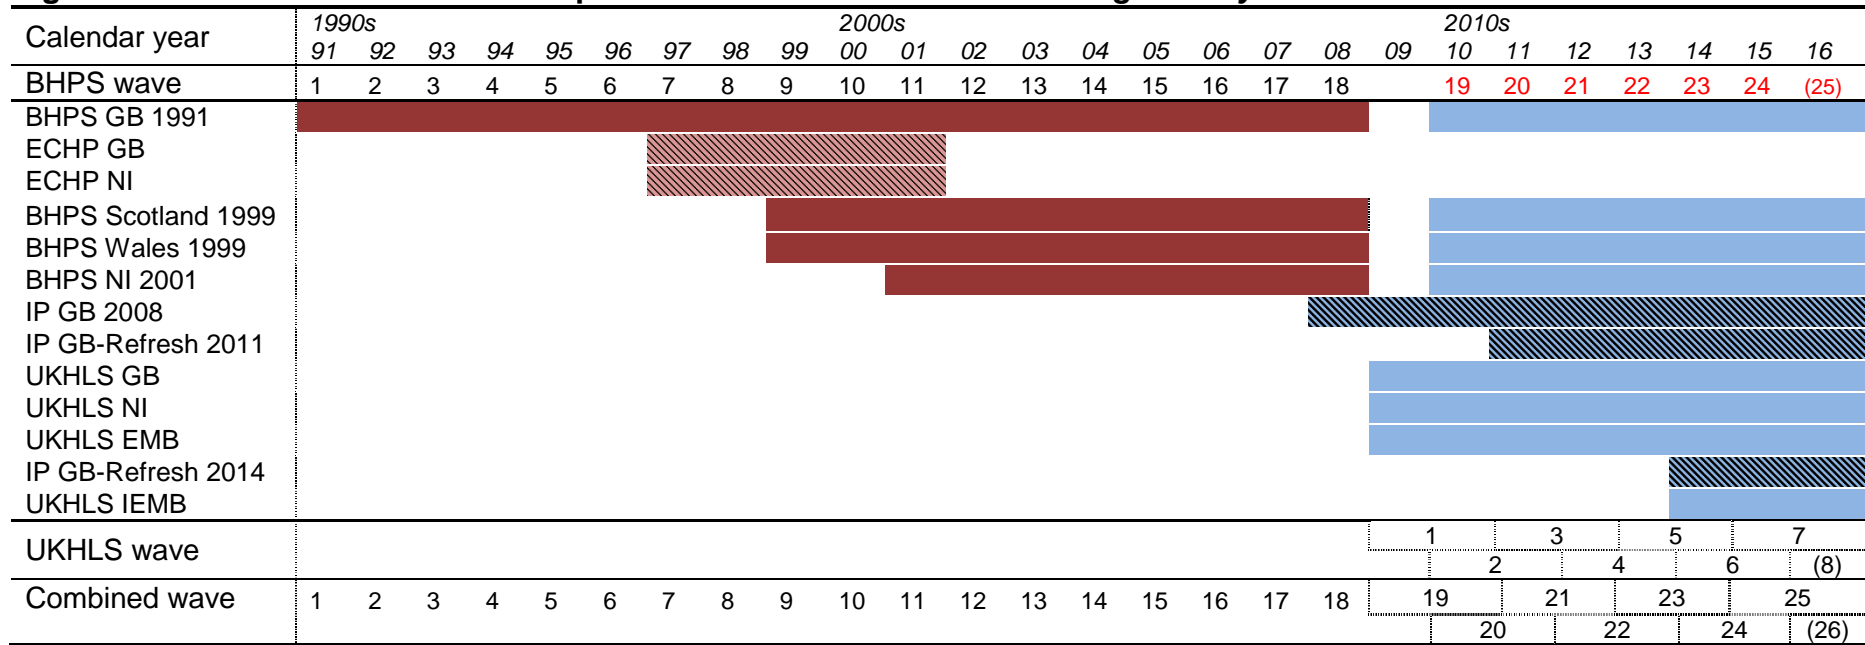

This guide is organised as follows. Section 1.2 provides a short overview of different usage of the data sets. Section 2 presents the harmonised BHPS. It outlines the principles that governed the production of the harmonised BHPS (Section 2.1) and how the harmonisation was implemented for data files (Section 2.3) and variables (Section 2.3). Section 3 describes the online documentation of the harmonised BHPS data, and Section 4 provides references on how to access the data. Section 5 gives analysts worked examples (in the Stata programming language) of how to exploit the harmonised BHPS and *Understanding Society* data together. Section 6 focuses on next steps in the '*Understanding Society* harmonised BHPS' project and Section 7 provides users with information about how to cite data and documentation.

1.2. USER GUIDANCE FOR DIFFERENT DATA USAGE ROUTES

Together, BHPS and *Understanding Society* provide rich data for longitudinal samples of individuals living in the UK going back to 1991. Figure 1 provides a schematic overview of the different samples and when they were introduced in the studies. BHPS samples are shaded maroon and *Understanding Society* samples are shaded light blue. Samples shaded with diagonal lines are not part of the UKHLS harmonised BHPS; they are included for completeness only. The top row lists the calendar years, followed by the BHPS wave count (continues in red once part of *Understanding Society*). The next rows list the BHPS and *Understanding Society* samples in chronological order. The last row indicates the *Understanding Society* wave count. Note that each wave in the *Understanding Society* stretches over two calendar years; data for the BHPS samples participating in *Understanding Society* is collected in the first year of each wave, starting from *Understanding Society* Wave 2.

There are four different data usage routes for the two studies: (1) using only BHPS Wave 1-18, (2) using only *Understanding Society* Wave 1-7, (3) combining the harmonised BHPS and *Understanding Society* data, but only using longitudinally the continuing BHPS sample, and (4) combining the harmonised BHPS and *Understanding Society* data cross-sectionally, without restricting the analysis to the continuing BHPS sample. For example, usage (3) is for researchers who want to carry out a longitudinal analysis at the individual level for a time span covering BHPS and *Understanding Society* years, while usage (4) is for researchers interested in studying an event (e.g., national wellbeing) over a long period of time (e.g., over 25 years).

Figure 1: Schematic overview of samples in the BHPS and *Understanding Society*

Notes: Fieldwork for each wave typically continues into the following calendar year. (#) Data for BHPS Wave 25, combined Wave 26, are being collected as part of UKHLS Wave 8 which will be released in November 2018.

1.2.1. USING BHPS WAVE 1-18 ONLY (USAGE 1)

Users who want to analyse BHPS Wave 1-18 only are advised to use the stand-alone BHPS and associated documentation. The BHPS documentation is available on the ISER webpage: <http://www.iser.essex.ac.uk/bhps>.

This online documentation covers:

- Information on how to acquire the data (<http://www.iser.essex.ac.uk/bhps/acquiring-the-data>)
- Information on the sample (<http://www.iser.essex.ac.uk/bhps/about/sample>)
- Information on content of the questionnaire (<http://www.iser.essex.ac.uk/bhps/about/questionnaire-content>)
- Frequently Asked Questions (<http://www.iser.essex.ac.uk/bhps/faqs>)

Volume A of the stand-alone BHPS User Guide ([Taylor 2010](#)) is a pdf file (<http://www.iser.essex.ac.uk/bhps/documentation/vola/vola.html>) which includes descriptive information about the survey and data. Appendix 2 provides descriptions of derived variables and Appendix 3 provides the variable labels for long code frames such as for the National Statistics Socio-economic classification (NSSEC). A slightly amended PDF copy of [Taylor \(2010\)](#) is also provided with the *Understanding Society* Wave 1-7 and harmonised BHPS Wave 1-18 data release.

Volume B of the BHPS User Guide is online-only and helps users identify which variables are available, where, for which waves, and so on. Volume B can be searched either by subject thesaurus, index terms, record types or waves. The URL is: <https://www.iser.essex.ac.uk/bhps/documentation/volb/index.html>.

We provide worked examples on using the BHPS in our online Moodle course (<https://www.understandingsociety.ac.uk/documentation/training/online/>) and additional user support is provided through our *Understanding Society* Online User Support Forum at <https://www.understandingsociety.ac.uk/support/projects/support>.

The BHPS Quality Profile ([Lynn, Buck et al. 2006](#)) provides a comprehensive overview of all aspects of the design and implementation of the BHPS and on sources of survey error.

In producing the *Understanding Society* harmonised BHPS data a small number of issues have been identified that needed correcting in the stand-alone BHPS. These issues have been addressed in the harmonised BHPS and will be addressed in a new release of the stand-alone BHPS and documentation in early 2018.

1.2.2. USING UNDERSTANDING SOCIETY WAVE 1-7 ONLY (USAGE 2)

The *Understanding Society* User Guide ([Knies 2017](#)) provides all necessary information for users who want to use only *Understanding Society* data. See Table 1 for key sections of the guide.

1.2.3. USING THE BHPS SAMPLE IN BOTH BHPS AND UNDERSTANDING SOCIETY DATA (USAGE 3)

Users who want to analyse information from up to 24 waves of harmonised BHPS and *Understanding Society* data for the continuing BHPS sample are advised to read this guide as an introduction. More detailed information about specific aspects of the

two studies is available in the stand-alone user guides and in the online documentation.

The appropriate weights for this usage route are the longitudinal weights provided in *Understanding Society* and described in Section 3.9 of [Knies \(2017\)](#). Figure 4, in this user guide, provides example code (in the Stata programming language).

1.2.4. USING BHPS WAVE 1-18 AND UNDERSTANDING SOCIETY WAVE 1-7 CROSS-SECTIONALLY (USAGE 4)

Users who want to use BHPS Waves 1-18 and *Understanding Society* Wave 1-7 cross-sectionally are advised to read this guide, as well as the stand-alone user guides and the on-line documentation.

The appropriate weights for this usage route are the cross-sectional weights provided in the two studies. For the BHPS, these are described in Section A5-1 – A5-12 of [Taylor \(2010\)](#). For *Understanding Society*, these are described in Section 3.9 of [Knies \(2017\)](#). Figure 5, in this user guide, provides example code (in the Stata programming language).

2. HARMONISING THE BHPS WITH *UNDERSTANDING SOCIETY*

2.1. PRINCIPLES

Four general principles guide the harmonised BHPS project. First, the aim of the project is revising the BHPS data, so they can be analysed more easily in conjunction with *Understanding Society* data. Therefore, most changes were made to the BHPS, and only minor changes were made to *Understanding Society*. Second, the harmonisation criteria are quite strict (see Section 3.4). This implies the quality of the harmonisation process across variables is roughly consistent, and data recoding and variable renaming is minimal. Third, the BHPS is released in full as part of *Understanding Society* Wave 7. In other words, content that cannot be or has not yet been harmonised is released alongside content that is equivalent to UKHLS. Fourth, the project is dynamic. The number of harmonised variables is likely to increase over time. This is because new matches can be found or made possible. Value added datasets (e.g., geographical identifiers) will be provided with future releases.

2.2. GENERIC NAMING CONVENTIONS

The BHPS and *Understanding Society* have many similarities. There is one set of files for each wave, there are stem names for files and variables and the wave is identified by a wave prefix. The content of files with the same name across the two studies is principally the same. For example, **indresp** files always contain information from adult interviews; **hhresp** files always contain information from household interviews and so on. However, there are also differences, such as different wave prefixes and variable naming conventions.

The harmonised BHPS uses the *Understanding Society* conventions. In particular:

Prefixes. Like *Understanding Society*, the harmonised BHPS uses a wave prefix followed by an underscore for variable and file names. To distinguish harmonised BHPS files and variables from *Understanding Society* ones, the harmonised BHPS wave prefix is preceded by the letter “b”. For example, the harmonised BHPS Wave 1 uses the prefix `ba_`, and the harmonised BHPS Wave 18 uses the prefix `br_`.

Identifiers. The harmonised BHPS includes the cross-wave person identifiers of both studies (**pidp** and **pid**) and both identifiers are applicable to all sample members. Likewise, it includes the within-wave household identifiers in the BHPS and *Understanding Society* formats (**bw_hid** and **bw_hidp**).

Suffixes. In line with the *Understanding Society* rules, the suffix “_dv” indicates derived variables, the suffix `_if` indicates imputation flags, and the suffix “_cc” indicates condensed versions of socio-economic classifications.

2.3. HARMONISATION OF DATA FILES

The BHPS and *Understanding Society* differ in the number and type of data files they contain. Both studies contain cross-waves and wave-specific files. In the following we summarize how files have been treated in the harmonised BHPS.

2.3.1. CROSS-WAVE FILES

Cross-wave files (**xwavedat**, **xwaveid**, **xivdata**, **xwlsten**) store information about all sample members ever enumerated in the respective study. The data files `xwavedat`, `xwaveid`, `xivdata` exist in both studies. The BHPS and the *Understanding Society* `xwavedat` files have been combined into one. The files **xwaveid** and **xivdata** have not been harmonised yet. **xwlsten** only exists in BHPS and thus did not require harmonisation.

Table 2 below gives details on how these files have been treated in the harmonised BHPS.

2.3.2. WAVE-SPECIFIC FILES

Both the BHPS and *Understanding Society* contain a number of wave-specific files. For the purpose of harmonisation, they can be divided in two groups. The first group is composed of data files which exist in both studies. Table 3 shows how these data files have been treated. Most data files (i.e., **indall**, **egoalt**, **indsamp**, **hhresp**, **indresp**, **youth**, and **income**) have been fully harmonised. The data file storing information about all issued households (**hhsamp**) has not been harmonised yet. The second group is composed of data files which exist only in the stand-alone BHPS (see Table 4). This group includes the **child** data file, which exists in both studies, but stores different information. No attempt has been made to harmonise data files with different names, or to harmonise the **child** data file. Note that there are also a number of files which only exist in *Understanding Society*. They are of no concern for the harmonisation project.

Table 2: Cross-wave data files in the two studies and their treatment

	BHPS		UKHLS	Description	Treatment received
	Stand-alone	Harmonised			
Harmonised	xwavedat	xwavedat		Contains stable characteristics of all individuals ever enumerated	Both studies' files have been fully combined in one data file containing cases from all sample members ever enumerated in either study. The variable xwdat_dv can be used to identify sample members enumerated in one or both the surveys.
Not yet harmonised	xwaveid	xwaveid_bh	xwaveid	Contains information for enumerated matching individuals between waves	The data file has largely different content in BHPS and <i>Understanding Society</i> . The data files have not (yet) been harmonised. The BHPS data file xwaveid was renamed to xwaveid_bh and all variables in the data file received the prefix bw_ and the suffix _bh
	xivdata	xivdata_bh	xivdata	Contains information about all interviewers ever enumerated	The data file has largely different content in BHPS and <i>Understanding Society</i> . The data files have not (yet) been harmonised. The BHPS data file xivdata was renamed to xwaveid_bh and all variables in the data file received the prefix bw_ and the suffix _bh
BHPS only	xwlsten	xwlsten	-	Contains information on the latest known sample status of all individuals ever enumerated	There is no equivalent to the BHPS data file xwlsten in <i>Understanding Society</i> . The data file was not renamed xwlsten and all variables in the dataset received the suffix _bh

Table 3: Wave-specific data files available in both studies and their treatment

BHPS		UKHLS	Description	Treatment received
Stand-alone	Harmonised			
windsamp	<i>bw_indsamp</i>	<i>w_indsamp</i>	Individual-level data for issued households	windsamp was renamed to bw_indsamp and all variables in the data file received the prefix <i>bw_</i> .
whhsamp	<i>bw_hhsamp_bh</i>	<i>w_hhsamp</i>	Sample and Household level data for issued households	whhsamp was renamed to bw_hhsamp_bh and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
windall	<i>bw_indall</i>	<i>w_indall</i>	Household grid data for all enumerated persons in household, including children and non-respondents	windall was renamed to bw_indall and all variables in the data file received the prefix <i>bw_</i> .
wegoalt	<i>bw_egoalt</i>	<i>w_egoalt</i>	Kin and other relationships between enumerated pairs of individuals in the household	wegoalt was renamed to bw_egoalt and all variables in the data file received the prefix <i>bw_</i> .
whhresp	<i>bw_hhresp</i>	<i>w_hhresp</i>	Substantive data from responding households	whhresp was renamed to bw_hhresp and all variables in the data file received the prefix <i>bw_</i> .
windresp	<i>bw_indresp</i>	<i>w_indresp</i>	Substantive data for responding adults (16+) including proxies and telephone interviews from individual questionnaires including self-completion	windresp was renamed to bw_indresp and all variables in the data file received the prefix <i>bw_</i> .
wincome	<i>bw_income</i>	<i>w_income</i>	Income and payment information for respondents	wincome was renamed to bw_income and all variables in the data file received the prefix <i>bw_</i> .
wyouth	<i>bw_youth</i>	<i>w_youth</i>	Substantive data from respondents to the youth questionnaire (age 11-15 for BHPS and 10-15 for UKHLS)	wyouth was renamed to bw_youth and all variables in the data file received the prefix <i>bw_</i> .

Table 4: Wave-specific data files included only in the BHPS and their treatment

BHPS		Description	Treatment received
Stand-alone	harmonised		
wjobhstd	<i>bw_jobhstd_bh</i>	Information from the employment history for responding adults, based on dependent interviewing	wjobhstd was renamed to <i>bw_jobhstd_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wjobhist	<i>bw_jobhist_bh</i>	Employment history for responding adults	wjobhist was renamed to <i>bw_jobhist_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wlifejob	<i>bw_lifejob_bh</i>	Information about jobs; held in employment spells for responding adults	wlifejob was renamed to <i>bw_lifejob_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wlifemst	<i>bw_lifemst_bh</i>	Information about employment status spells; for responding adults	wlifemst was renamed to <i>bw_lifemst_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wchild	<i>bw_child_bh</i>	Information about respondent's children	wchild was renamed to <i>bw_child_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wcohabit	<i>bw_cohabit_bh</i>	Data about each cohabitation spell outside legal marriage; for responding adults	wcohabit was renamed to <i>bw_cohabit_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wmarriag	<i>bw_marriag_bh</i>	Information about previous marriages; for responding adults	wmarriag was renamed to <i>bw_marriag_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wchildad	<i>bw_childad_bh</i>	Information about adopted and/or step-children for responding adults	wchildad was renamed to <i>bw_childad_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .
wchildnt	<i>bw_childnt_bh</i>	Information about natural children for responding adults	wchildnt was renamed to <i>bw_childnt_bh</i> and all variables in the data file received the prefix <i>bw_</i> and the suffix <i>_bh</i> .

2.3. HARMONISATION OF VARIABLES

2.3.1. GENERAL PROCEDURE

The aim of the project was to identify *Understanding Society* variables equivalent to one or more BHPS variables; this was done in the following steps:

1. We identified one (or more) *Understanding Society* candidate match variable(s) for a BHPS variable. This involved an automated search to match variables with the same or similar variable stem name or label in each study. Further matches were identified by experts (*Understanding Society* team members and beta users).
2. We determined whether the BHPS variable and its candidate *Understanding Society* match were sufficiently similar to be treated as equivalent. We checked for equivalence in question wording, question routing (i.e., the subset of respondents who are asked the question), response options and mode of administration.
3. We determined whether a modification could make the BHPS variable and its candidate *Understanding Society* match similar enough to treat as equivalent
4. We determined whether a set of BHPS variables could be combined to create a new variable equivalent to the candidate *Understanding Society* match.

Figure 2 illustrates the outcomes of the process above for the generic BHPS variable *wstem*.

- If stem name and content were the same in both studies or if no variable existed that conveyed the equivalent information in the UKHLS, *wstem* was renamed *bw_stem*.
- If equivalent information existed under a different variable stem name in the *Understanding Society*, *wstem* received the stem name of that variable and the wave prefix, i.e. *bw_newstem*.
- If the information conveyed in *wstem* and *w_stem* was different and no *Understanding Society* variable could be found or created to match the content of *wstem*, *wstem* was renamed to *bw_stem_bh*.
- If a BHPS variable could be modified to match the content of the *Understanding Society* variable *w_stem*, a clone of the BHPS variable was created and modified (*bw_newstem*), and the original renamed as *bw_stem_bh*.
- If a BHPS variable could be combined with other BHPS variables to match the content of the UKHLS variable *w_newstem*, a new variable *bw_newstem* was created by combining those variables.

Figure 2: Flow chart of harmonisation of variables

2.3.2. PROCEDURES FOR SPECIFIC TYPES OF VARIABLES

2.3.2.1. Identifiers and pointers to other household members

All sample members of the harmonised BHPS have a person and household identifier (**pidp**, **bw_hidp**). No changes were made to the BHPS within-wave person number **wpno**. The identifiers **pidp** and **bw_hidp** work across harmonised BHPS and *Understanding Society* files, and the **bw_hid** **bw_pno** can be used to link to other BHPS data currently not harmonised.

Both BHPS and *Understanding Society* provide a range of pointers to significant others, that is variables indicating the unique cross-wave person identifier or within-wave person numbers of significant others in the household. Pointers are based on information about within-household relationships. Although protocols for collecting this information varied across the two studies, there is a broad equivalence of constructs. Therefore, pointers have been considered in principle equivalent.

Table 5 shows identifiers and pointers in the stand-alone BHPS and how they have been named in the harmonised BHPS. Note that pointers containing the cross-wave person identifier have received the suffix **_bh** because pointers in BHPS report the **pid**, whilst pointers in *Understanding Society* report the **pidp**.

Table 5: Overview of identifiers and pointers in the harmonised BHPS

Stand-alone BHPS	Harmonised BHPS	Description
pid	pid	Unique person identifier (BHPS cohort)
	pidp	Unique person identifier (BHPS & UKHLS cohort)
whid	bw_hid	Within-wave household identifier (BHPS cohort)
	bw_hidp	Within-wave household identifier (BHPS & UKHLS cohort)
wpno	bw_pno	Person number within current household
whgspn	bw_ppno	PNO of spouse/partner (edited)
whgra	bw_hgra	PNO of adult responsible for child under age 18 (HHGRID).
wrapid	bw_rapid_bh	ID of adult responsible for child under age 18 (HHGRID)
whgmno	bw_hgbiom	PNO of natural mother (HHGRID)
wmpid	bw_mnpid_bh	ID of natural mother (edited)
wmnsyno	bw_mnsyno	PNO of nat./step/adopt. mother (edited)
wmnsyid	bw_mnsyid_bh	ID of nat./step/adopt. mother (edited)
whgfno	bw_hgbiof	PNO of natural father (HHGRID)

wcosano	bw_cosano	PNO of adult asked for consent to link child's administrative records (HHGRID)

2.3.2.2. Batteries of questions

Batteries of questions are series of related questions with a common stem name. Some of these batteries of questions measure well-established constructs such as the General Health Questionnaire (GHQ).

Some batteries of questions used in the BHPS were entirely carried over into *Understanding Society*; others were carried over only partially. In cases where the batteries were entirely carried over into *Understanding Society* the variable-renaming followed the procedure explained in Figure 2. For example, the components of the battery measuring the GHQ were renamed from **wghqa-wghql** to **bw_scghqa-bw_scghql** in the harmonised BHPS, to match the *Understanding Society* equivalent variable names **w_scghqa- w_scghql**. In cases where the batteries of questions were only partially carried over into *Understanding Society*, the original battery of questions was kept with the original name, and the questions carried into *Understanding Society* were duplicated and given the *Understanding Society* stem name and the harmonised BHPS prefix.

An example for this case is shown in Table 6.

Table 6: Series wnvest and its treatment in the harmonised BHPS

stand-alone BHPS	harmonised BHPS	UKHLS
wnvesta	bw_nvesta	
wnvestb	bw_nvestb	w_svacts5
	bw_svacts5	
wnvestc	bw_nvestc	
wnvestd	bw_nvestd	
wnveste	bw_nveste	
wnvestf	bw_nvestf	
wnvestg	bw_nvestg	
wnvesth	bw_nvesth	w_svacts1
	bw_svacts1	
wnvesti	bw_nvesti	w_svacts2
	bw_svacts2	
wnvestj	bw_nvestj	
wnvestk	bw_nvestk	

2.3.2.3. Derived variables

Both the BHPS and *Understanding Society* include a range of derived variables. Derived variables are constructed using algorithms combining one or more pieces of information collected in the study (see [Taylor, 2010](#), Appendix 2, and [Knies 2017](#), Section 2.7). We harmonised derived variables already existing in the stand-alone BHPS and *Understanding Society* following the procedure described in Section 2.1 above. We did not harmonise the algorithms. The harmonised BHPS variables were given the *Understanding Society* stem names and prefixes.

2.3.2.4. Income variables

Both BHPS and *Understanding Society* collect information on earnings, investment income, and other sources of income such as benefits, pensions, and educational grants, alimonies, rent from boarders and lodgers, and payments from family members. Information on monthly earnings/income is comparable in the two studies. The top panel of Table 7 shows the harmonised derived income variables and associated imputation flags available in the harmonised BHPS. Again, harmonisation is at the variable- and construct- level. The algorithms used to construct these derived income variables and the imputation methods have not been harmonised. Full information on annual income is only available in BHPS. Therefore, information on annual income is largely not harmonised. A list of not harmonised income variables is provided at the bottom of Table 7.

Table 7: Income variables and their harmonisation

BHPS		Description
stand-alone	harmonised	
wpayn	bw_payn_dv	Net pay per month in current job: last payment
wpaynu	bw_paynu_dv	Usual net pay per month: current job
wpaynui	bw_paynu_if	Usual net pay per month current job: Imputation flag
wpayg	bw_payg_dv	Gross pay per month in current job: last payment
wpaygu	bw_paygu_dv	Usual gross pay per month: current job
wpaygui	bw_paygu_if	Usual gross pay per month current job: imputation flag
wfimnl	bw_fimnlabgrs_dv	Total monthly labour income
wfimn	bw_fimngrs_dv	Total personal income: gross
wj2pay	bw_j2pay_dv	Gross earnings from second jobs last month
wj2payi	bw_j2pay_if	Gross earnings from second jobs last month: imputation flag
wfrval	bw_frval	Benefits/Unearned Income: Last amount received
wj2payi	bw_j2pay_if	Gross earnings from second jobs last month: imputation flag
BHPS income variables not currently harmonised:		
fimnli frvali fimnnl fimnnli fimnsel fimnt fimnthi fimnti fiyeari fiyr fiyrl fiyrli fiyrnl fiyrnli jspayg jspaygi jsprof jsprofi paygli paygly paygti paygty paynli paynly paynti paynty sppayg tlfyir tlfyirl fihhmb fihhmbi fihhmp fihhmpi fihhmt fihhmti fihhyb fihhybi fihhyp fihhybi fihhyti fimnb fimnbi fimnp fimnpi fiyrb fiyrbi fiyrp fiyrpi fiyrt fiyrti.		
Note that the BHPS wj2pay has been also copied as bw_wj2pay_bh .		

2.3.2.5. Sample design variables

The BHPS and *Understanding Society* are based on nine samples (see Figure 1). The description of these samples is provided in the stand-alone BHPS and *Understanding Society* user guides.

The variables describing the sampling unit and stratification are supplied in the **xwavedat** data file and have been harmonised. The primary sampling unit variable **psu** indicates the primary sampling unit (PSU) to which the sample member belongs. Its value does not change over time. The stratification variable **strata** indicates the sampling stratum from which the sample member was selected. Its value does not change over time. For new sample entrants, the psu and strata values are defined only from the wave at which they enter the sample. Note that some harmonised BHPS files include the variables **psu_bh** and **strata_bh**: these are the original primary sampling unit and stratification variables in the stand-alone BHPS.

The variable **hhorig** on data file **xwavedat** can be used to inspect the sample origin for individuals. The code frame for this variable has been adjusted in both studies to reflect samples across both studies (see Table 8). Note that some harmonised BHPS files contain the variable **bw_hhorig_bh**: this is the original sample origin variable in the stand-alone BHPS.

Please note that many of the samples of BHPS and *Understanding Society* are not designed as stand-alone samples and selecting them using variables such as **hhorig**, can lead to wrong results. We recommend that users choose the appropriate population weights provided in the studies: using weights automatically selects respondents from the samples of interest.

Table 8: Harmonised coding frame for the sample origin indicator (hhorig)

BHPS		UKHLS		New harmonised coding frame	
1	original sample	1	ukhls gb 2009-10	1	ukhls gb 2009-10
2	echp-scpr	2	ukhls ni 2009-10	2	ukhls ni 2009-10

6	scotland new sample	6	bhps ni 2001	6	bhps ni 2001
7	n.i. new sample	7	ukhls emboost 2009-10	7	ukhls emboost 2009-10
		8	ukhls iemb 2014-15	8	ukhls iemb 2015
		11	ip original sample	11	ip original sample
		12	ip4 refresher sample	12	ip4 refresher sample
		13	ip7 refresher sample 2014	13	ip7 refresher sample 2014
				14	echp-scpr
				15	echp-ons
				16	echp-ni

Notes: Greyed out samples do not have any cases in the harmonised BHPS and *Understanding Society* files.

2.3.2.6. Survey Weights

Both BHPS and *Understanding Society* provide survey weights and use specific naming conventions to help users identify the correct weights for their analysis. These study-specific naming conventions have been retained in the harmonised BHPS. In other words, weights in the harmonised BHPS have kept the same stem name, but have received the wave-prefix *bw_*.

2.3.3. VALUE AND VARIABLE LABELS

Value and variable labels have not been fully harmonised yet. While the content of the labels is the same, the exact wording may differ.

2.3.3.1. Missing values

The general missing value definition in the BHPS and *Understanding Society* is identical. In creating the harmonised BHPS files we retained the original BHPS values. Missing value definitions may vary across studies. Table 9 lists the missing value codes used in the harmonised BHPS.

Table 9: Missing value codes

Value	Description
-21	No data from the UKHLS
-20	No data from the BHPS Wave 1-18
-11	Only available for the IEMBS
-10	Not available for the IEMBS
-9	Missing by error or implausible
-8	Not applicable to the person or because of Routing
-7	Proxy respondent. The question was not asked of proxy respondents or derived variable cannot be computed for proxy respondents.
-2	Refused
-1	Don't know

3. DOCUMENTATION

The harmonised BHPS is documented as part of the main *Understanding Society* study website www.understandingsociety.ac.uk/documentation/. PDFs of the questionnaires used in the BHPS are provided in the questionnaire tab. Note that the question names in the questionnaires have not been updated to reflect the harmonised BHPS variable names. We provide a look-up file for BHPS variables that have been harmonised, allowing users to learn about the origin of harmonised variables, see <https://www.understandingsociety.ac.uk/d/349/HarmoDocuAll.xls>. The information is also provided in the variable level view of the online documentation.

Other fieldwork materials used in the BHPS are provided in the “Other fieldwork materials” tab.

4. DATA RELEASE

The data are released through the UK Data Service (UKDS) in SPSS, Stata and CSV formats. While documentation is released through the UKDS, we encourage users to consult the *Understanding Society* webpage. The online documentation will develop over time.

The *Understanding Society* harmonised BHPS is released as part of the main *Understanding Society*. The data are released according to the conditions of the regular UKDS End User Licence (EUL): <http://ukdataservice.ac.uk/get-data/how-to-access/conditions.aspx#/tab-end-user-licence>. These data are listed as SN 6614 - *Understanding Society: Waves 1-7, 2009-2016* and harmonised British Household Panel Survey: Waves 1-18.

Some additional end-user licence data products available for the BHPS cases are listed in Table 10. These data can be linked using the BHPS unique identifiers (**pid** and **whid**). For files at the household level, (e.g., the Derived Current and Annual Net Household Income Variables, SN 3909) the original format of the **hid** is used (e.g., **rhid** rather than **br_hid**) and these will need renaming in order to match the files.

All these data can be accessed directly by replacing ## by the Study number in the following URL: <https://discover.ukdataservice.ac.uk/catalogue/?sn=##>

Table 10: BHPS data products available through the UKDS

Study	Study no	Study Title
BHPS	5151	British Household Panel Survey: Waves 1-18, 1991-2009
BHPS	3909	British Household Panel Survey Derived Current and Annual Net Household Income Variables, Waves 1-18, 1991-2009
BHPS	5629	British Household Panel Survey Consolidated Marital, Cohabitation and Fertility Histories, 1991-2009
BHPS	7821	British Household Panel Survey: Programs for Generating Consistent Work-Life Histories: Waves 1-18, 1991-2009
BHPS	3954	British Household Panel Survey Combined Work-Life History Data, 1990-2005
BHPS	5354	Human Capital and Social Position in Britain: Creating a Measure of Wage-Earning Potential from BHPS Data, 1991-2004
BHPS	5356	British Household Panel Survey Calibrated Time Use Data, 1994-2004
UKHLS	6614	<i>Understanding Society: Waves 1-7, 2009-2016</i> . Includes harmonised BHPS Wave 1-18.
UKHLS	7251	<i>Understanding Society: Waves 2-3 Nurse Health Assessment, 2010-2012</i> . Includes cases from the BHPS.

A number of sensitive data files are released under Special Licence (SL). Currently, the only harmonised BHPS data available under SL are included in the core *Understanding Society* SL data. The data are listed as SN 6931 - *Understanding Society: Waves 1-7, 2009-2016* and harmonised British Household Panel Survey: Waves 1-18: Special Licence Access. The data is a copy of the EUL data (SN 6614) that contains the month of birth, full occupational coding, rare country of

birth/nationality occurrences and uncapped income variables (for both harmonised BHPS and UKHLS files). Additional SL data products such as harmonised geographies will be added in due course.

Researchers can apply for access to SL data through a UKDS application procedure. Researchers will be required to justify their research objectives and explain why EUL data alone would be inadequate to reach those objectives. They will also be asked to report publications resulting from using the data. The conditions for using SL data are provided at <http://ukdataservice.ac.uk/get-data/how-to-access/conditions/special-licence.aspx>

5. EXAMPLE STATA CODE

In this section we provide examples for using the long run of panel data from the harmonised BHPS and UKHLS files. These examples illustrate how the data may be set up in principle. They do not present a perfect template for all types of analyses.

Figure 3 presents code to extract respondents' age, sex and highest qualification variables from the **indresp** files in all waves and both studies. Wave prefixes are removed, a new wave indicator that works across both sets of files is generated and the files are appended in long format. The resulting file includes information for everyone who has ever provided a full adult or proxy interview in the BHPS or in *Understanding Society*.

Figure 3: Example Stata Code: Merging individual files from harmonised BHPS and UKHLS in long format

```
// Load wave-specific info from BHPS files using loops. Generate wave identifier,
// remove wave prefixes, and save
foreach x in a b c d e f g h i j k l m n o p q r {
    use pidp b`x'_age_dv b`x'_hiqual_dv b`x'_sex using b`x'_indresp, clear
    gen wave=strpos("abcdefghijklmnopqr", "`x'")
    save b`x'_indresp_junk, replace
}
// Load wave-specific info from UKHLS files using loops. Generate wave identifier,
// remove wave prefixes, and save
foreach x in a b c d e f g {
    use pidp `x'_age_dv `x'_hiqual_dv `x'_sex using `x'_indresp, clear
    rename `x'_* *
    gen wave=strpos("abcdefghijklmnopqr", "`x'")+18
    save `x'_indresp_junk, replace
}
// Append the data files in long format. Note that you can loop over all waves
use ba_indresp_junk, clear
foreach x in bb bc bd be bf bg bh bi bj bk bl bm bn bo bp bq br a b c d e f g {
    append using `x'_indresp_junk
}
sort pidp wave
save all_indresp, replace
```

Figure 4 presents Stata code to undertake a longitudinal analysis of wellbeing in Britain for the continuing BHPS sample drawing on information from one BHPS and one UKHLS wave (data usage route 3, see Section 1.2.4 above). The appropriate longitudinal population weight is chosen, as well as the variables defining the complex survey design.

Figure 4: Example Stata code: Weighted longitudinal analysis of wellbeing in Britain (Usage 3)

```
use pidp bq_scghq1_dv bq_jbstat using bq_indresp, clear
rename bq_* *
// define a time variable
gen time=1
// Assure yourself that variables named the same are the same across all BHPS
// and UKHLS waves. The code frame for jbstat changed, as you can read in the
// online variable documentation and see by inspecting the variable in both
// studies. First see the BHPS JBSTAT code frame:
fre jbstat
save bq_indresp_junk, replace

use pidp c_scghq1_dv c_jbstat c_indin91_lw c_psu c_strata using c_indresp, clear
rename c_* *
// define a time variable
gen time=2
// Assure yourself that JBSTAT is the same across all BHPS and UKHLS waves.
// E.g. the code frame for jbstat changed in the UKHLS and needs to be recoded:
fre jbstat
recode jbstat (10 11=97)
save c_indresp_junk, replace

// Merge files from different waves. Note that labels in UKHLS are in better shape
// so merge harmonised BHPS files to UKHLS files (or make sure not to overwrite labels)
use c_indresp_junk, clear
append using bq_indresp_junk
// balanced panel: duplicates=1
duplicates tag pidp, gen(dup1)
keep if dup1==1
for var _all: replace x=. if x<0
// distribute unit's last wave longt'l weight, psu and strata to all waves
sort pidp wave
bys pidp: replace indin91_lw=indin91_lw[_N]
bys pidp: replace psu=psu[_N]
bys pidp: replace strata=strata[_N]
// tell stata this is non-random sample
svyset psu, str(strata) singleunit(scaled)
// Run your stats taking account of complex survey design and attrition,
// e.g., mixed effects random effects regression of GHQ on employment status
svy: meglm scghq1_dv i.jbstat || pidp:, cov(un) pw(indin91_lw)
```

Figure 5 presents Stata code to merge information from the BHPS and UKHLS for a pooled cross-sectional analysis (data usage route 4, see Section 1.2.4 above). The key take-home point is that the variable names for the respective studies' cross-sectional population weights for the UK need to be aligned.

Figure 5: Example Stata code: Weighted cross-sectional time series analysis of wellbeing in the United Kingdom (Usage 4)

```
// Load employment status, GHQ and cross-sectional UK population weight from BHPS files
// Rename weight and compute wave identifier
foreach x in bq bp {
  use pidp `x'_scghq1_dv `x'_jbstat `x'_xrwtk1 using `x'_indresp, clear
  rename `x'_* *
  gen wave=strpos("abcdefghijklmnopqr", "`x'")
  clonevar ukpopw=xrwtk1
  lab var ukpopw "UK population weight for current wave"
  save `x'_indresp_junk, replace
}
// Load employment status, GHQ and cross-sectional UK population weight from UKHLS files
// Rename weight and compute wave identifier
foreach x in b c {
  use pidp `x'_scghq1_dv `x'_jbstat `x'_indinub_xw using `x'_indresp, clear
  rename `x'_* *
  gen wave=strpos("abcdefghijklmnopqr", "`x'")+18
  clonevar ukpopw=indinub_xw
  lab var ukpopw "UK population weight for current wave"
  // align code frames for jbstat
  recode jbstat (10 11=97)
  save `x'_indresp_junk, replace
}
// Append BHPS and UKHLS files. Note that labels in UKHLS are in better shape so merge
// harmonised BHPS files to UKHLS
use c_indresp_junk, clear
foreach x in b bp qg {
  append using `x'_indresp_junk
}
// sort by unit and time
sort pidp wave
for var _all: replace x=. if x<0
// tabulate population estimates of average GHQ by employment status for the two periods
table jbstat wave [pw= ukpopw], c(mean scghq1_dv)
```

6. THE UNDERSTANDING SOCIETY HARMONISED BHPS PROJECT: NEXT STEPS

The harmonised BHPS project is ongoing. We welcome user feedback on the data and look forward to your suggestions for improvement. Please email your feedback to: consult@understandingsociety.ac.uk

User feedback will be considered in the future development work. We plan to publish a first updated harmonised BHPS in Summer 2018 as part of a planned within wave release and a second updated version in November 2018 as part of the standard Wave 8 data release.

7. CITATIONS AND ACKNOWLEDGEMENTS

Any publication, whether printed, electronic or broadcast, based wholly or in part on the *Understanding Society* data collection provided by the UK Data Service must be

accompanied by the correct citation and acknowledge the Institute for Social and Economic Research as the data provider and the UK Data Service as the data distributor. The acknowledgement, which gives credit to sponsors or distributors, is not a replacement for a proper citation. We recommend the following wording:

“*Understanding Society* and BHPS are funded by the Economic and Social Research Council and various Government Departments, with scientific leadership by the Institute for Social and Economic Research, University of Essex, and survey delivery by NatCen Social Research and Kantar Public. The research data are distributed by the UK Data Service.”

7.1. CITATION OF THE DATA

The format for bibliographic references is as follows:

University of Essex. Institute for Social and Economic Research, NatCen Social Research and Kantar Public, [producers]: *Understanding Society*: Waves 1-7, 2009-2016 and harmonised British Household Panel Survey: Waves 1-18 [computer file]. 9th Edition. Colchester, Essex: UK Data Service [distributor], November 2017. SN: 6614, <http://dx.doi.org/10.5255/UKDA-SN-6614-8>.<http://dx.doi.org/10.5255/UKDA-SN-6614-9>.

7.2. CITATION OF THE USER GUIDE

This User Guide is to be cited as follows:

Fumagalli, Laura, Knies, Gundi and Buck, Nick (2017): *Understanding Society*: The UK Household Longitudinal Study harmonised British Household Panel Survey (BHPS) User Guide. Colchester: University of Essex.

7.3. ACKNOWLEDGMENTS

People who contributed to the writing of the *Understanding Society* harmonised BHPS User Guide for this release include, in alphabetical order: Stephanie Auty, Michaela Benzeval, Olena Kaminska and Peter Lynn. The *Understanding Society* harmonised BHPS project is led by Laura Fumagalli and Nick Buck with the support of the *Understanding Society* team. A very big “Thank you!” goes to the many people who have and continue to contribute to the unrelenting success and timely delivery of *Understanding Society* and particularly to the harmonised BHPS project. They include, in addition to the aforementioned, (in alphabetical order): Geoff Angel, Gina Anghelescu, Glenn Dunn, Paul Fisher, Nicole James, Graham Jolliffe, Alita Nandi, Jonathan Nears, John Payne, Elaine Prentice-Lane, and Catherine Yuen. We would also like to thank our beta users for their valuable comments on test versions of the data. These beta users are, in alphabetical order: Giuseppe Forte, Vernon Gayle, Alessandra Guariglia, Andrew Henley, Gundi Knies, Kenisha Russell Johnson, Bertha Rohenkohl Cruz, Alireza Sepahsalari, Peter Spittal, Joanna Tyrowicz, George Ward, David Wright, Min Zheng, and Muzhi Zhou.
