

National Travel Survey

Technical Report 1998

Stephanie Freeth

Social Survey Division

London: Office for National Statistics

About the Office for National Statistics

The Office for National Statistics (ONS) is the Government Agency responsible for compiling, analysing and disseminating many of the United Kingdom's economic, social and demographic statistics, including the retail prices index, trade figures and labour market data, as well as the periodic census of the population and health statistics. The Director of ONS is also Head of the Government Statistical Service (GSS) and Registrar-General in England and Wales and the agency carries out all statutory registration of births, marriages and deaths there.

Editorial policy statement

The Office for National Statistics works in partnership with others in the Government Statistical Service to provide Parliament, government and the wider community with the statistical information, analysis and advice needed to improve decision-making, stimulate research and inform debate. It also registers key life events. It aims to provide an authoritative and impartial picture of society and a window on the work and performance of government, allowing the impact of government policies and actions to be assessed.

Acknowledgements

Thanks are due to the headquarters staff and interviewers in Social Survey Division of ONS whose consistent hard work has led to the success of the survey. Thanks, of course, are also due to the staff at the Department for the Environment, Transport and the Regions for their advice, guidance and support.

Chapter 1 Introduction

1.1 Background

The National Travel Survey (NTS) provides regular, up-to-date data on personal travel and monitors changes in travel behaviour over time. The first NTS was commissioned by the Ministry of Transport in 1965/66. Further periodic surveys were carried out in 1972/73, 1975/76, 1978/79 and 1985/86. In 1988 the NTS became a continuous survey with field work being carried out every month of the year.

Social Survey Division (SSD) of the Office for National Statistics (ONS) carried out the NTS in 1972/73 and 1985/86 and has been the contractor for the continuous NTS since its launch in 1988. SSD is responsible for questionnaire design, sample selection, data collection, data editing and data file production. Analysis and report production are carried out by the Department for the Environment, Transport and the Regions (DETR), the commissioning department for the survey. An edited database is sent to DETR every 3 months and is produced 2 months after the end of fieldwork.

This report describes the methodology of the 1998 NTS. It is intended as a working reference manual and describes the sample design, fieldwork methodology, data production and data file production.

1.2 Uses of the NTS

The NTS provides detailed information on different types of travel; where people travel from and to (at county level), distance, time, purpose and what kinds of people are doing the travelling and how often. The NTS is the only source of national information on subjects such as cycling and walking which provide a context for the results of more local studies.

The results of the survey are published by DETR and are available to users both within and outside Government. Travel research institutes such as the Transport Research Laboratory (TRL) view the NTS as one of their major data sources and the NTS datasets are deposited at the Data Archive at the University of Essex. Details on the use of the NTS are presented in Figure 1.1.

1.3 Sequence of work on the NTS

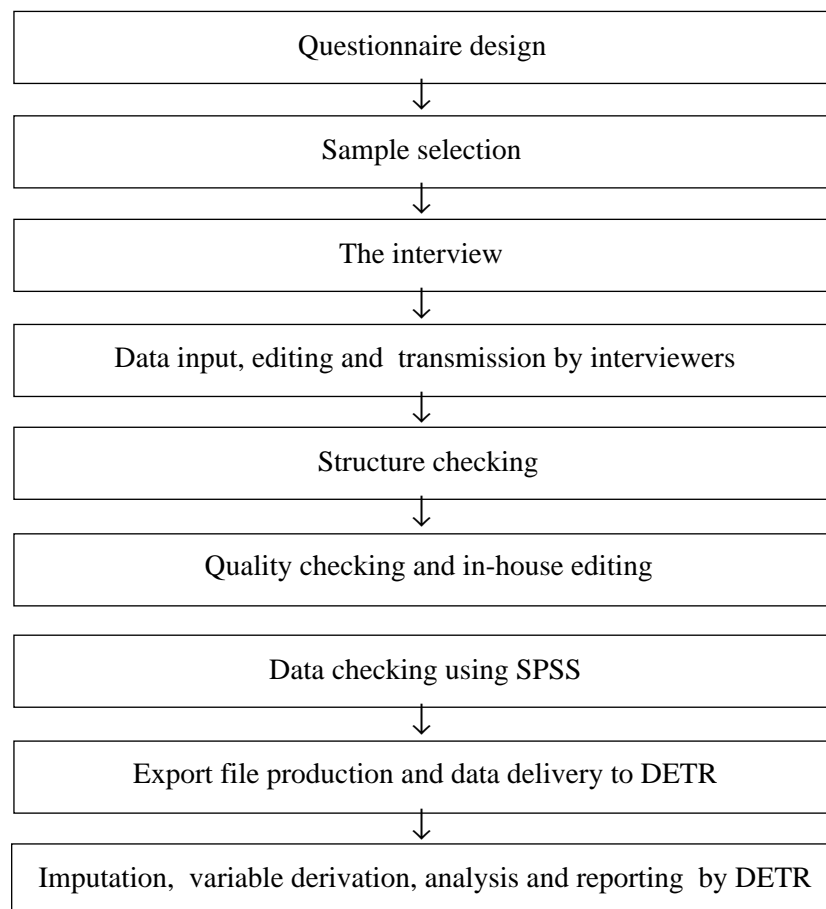

The NTS collects data using two methods: face-to-face interviewing carried out using computer assisted personal interviewing (CAPI) and seven day travel diary keeping. The sequence of tasks carried out on the 1998 NTS is summarised in this section and in Figure 1.2. Details on individual procedures are set out in the remainder of the report.

Figure 1.1 Uses of the NTS

The DETR has used the NTS to:

- build up a general picture of changes in personal travel over time, for all modes including walking, cycling, car and public transport
- examine travel among special groups in the population such as children, the elderly or disabled
- estimate accident rates on the basis of exposure to accident risk for different groups in the population
- establish the level of take up of concessionary fares among those entitled to such fare schemes such as the elderly
- estimate annual mileage for cars (as opposed to other light vehicles such as taxis or vans); this information is used when road tax and fuel tax payments are under consideration
- estimate the effect that a change in this balance of road tax to fuel tax would have on different kinds of households
- examine changes over time in travel for different purposes, such as commuting, business, education, shopping and leisure
- collect information about whether people use leaded or unleaded petrol or diesel in their vehicles
- assess the extent to which tax concessions available to those with company cars encourage extra mileage
- examine the relationship between the level of car ownership and the level of bus patronage at regional level
- examine car ownership levels and the availability of bus services in rural areas.

Figure 1.2 Sequence of work

1.3.1 Sample selection

The NTS is based on a random **sample** of private households. The 1998 sample size was 5,040 addresses drawn from the **Postcode Address File**. The addresses selected were allocated into interviewer quotas in such a way that each quarter's sample was nationally representative.

1.3.2 The interview

In advance of the interviewer's first call, letters were sent to the sampled addresses. These letters introduced the survey and explained that an interviewer would call shortly.

The NTS sampled allocation month ran from mid-month to mid-month. The interviewer would usually start to make contact with the household at the beginning of the calendar month in which the seven day

diaries (travel records) would be kept. A **placement call** would be set up prior to the start of the record keeping week (**travel week**) specified for that household. At the placement call, the interviewer would conduct an interview. After the interview, the interviewer explained the travel record keeping procedure in detail.

The placement call was generally followed by a **reminder call**, just before the start of the travel week, to remind the household to begin their travel records, and by a **midweek checking call** during the travel week to check that the records were being completed correctly.

The interviewer made a **pick-up call** to collect the travel records and to check the information recorded with the informants. A few additional questions were also asked. The pick-up call was made within six days of the end of the travel week. Figure 1.3 summarises the calls made to a household.

Figure 1.3 The interview

1.3.3 Data input and editing during the field work period

Working at home, the interviewer transferred and coded the travel information from the **travel records** to the **computerised Journey Input System**. Any inconsistencies identified at this stage were corrected by the interviewer and, if necessary, checked with the informant.

The interviewer then ran the **journey checking program** (pre-specified consistency and plausibility checks) and made the appropriate amendments, again checking back with informants where necessary or referring to the interviewer instructions.

Throughout the field period SSD staff monitored the progress of interviewer's work and answered coding and technical queries.

On a weekly basis interviewers transmitted data to ONS office. Any paper documents were returned by post at the end of the field period. The final transmission and posting date was the 28th day of the month in which field work was completed.

1.3.4 Final data editing and checking and data file production

The transmitted data were structure checked to make sure that all the data transmitted by the interviewers had been received. All returned paper documents were also checked.

Some final coding and checking was then carried out in the office. Manual recodes and interviewer's notes were scrutinised. Quality checks were also made on selected interviewers on a rota basis.

The data was organised into seven record types and sent to DETR on a quarterly basis. The seven record types consisted of: households, individuals, vehicles, long distance journeys made before start of the seven-day Travel Week (two records), journeys made during the Travel Week and stages of the journeys made during the Travel Week.

1.4 Response

Only households classed as 'fully co-operating' were included in the response calculations.¹ In 1998 a national response rate of 65% was achieved.² Under the current contract, the DETR measures response according to Achieved Sample Rates (ASRs). Unlike the usual SSD response measure, ASRs include sampled addresses classified as 'ineligible' in the denominator.³ In 1998 a national Achieved Sample Rate of 58% was achieved.

Notes

1. See 3.8.4 for a description of the term 'fully co-operating'.
2. The response data in this report are provisional figures produced from the ONS Field Case Management System. They may differ slightly from the final figures on the analysis database.
3. See Section 2.3.2 for the definition of an ineligible address.

Chapter 2 Sample Selection

2.1 The sample requirements

The survey is required to provide a comprehensive picture of personal travel behaviour by people living in private households in Great Britain. The sample was designed to provide a representative sample of households in Great Britain. The NTS has an annual two-stage set sample of 5,040 addresses with each member of each household providing information about journeys made in a pre-selected seven day period (the travel week). As travel behaviour varies considerably depending on the month of the year or day of the week, interviewing and travel record keeping were spread evenly over the year. Most analysis are carried out on three years data combined, making the total set sample size the same as that of each of the previous periodic surveys (15,120). A base of 15,120 provides the degree of precision required by DETR.

2.2 Sample design

2.2.1 The sampling frame

The NTS is based on a random sample of private households. The sampling process is carried out by the Sampling Implementation Unit (SIU) at ONS. The sample is selected using the 'small user' Postcode Address File (PAF), as a sampling frame. The PAF is constructed by the Post Office as a list of all addresses (delivery points) in the country. The 'small user' Postcode Address File is the file of delivery points which receive fewer than 25 items of mail each day. By using the small user file most large institutions and businesses are excluded from the sample.¹ However, some small businesses receive fewer than 25 items of mail a day and are included in the small user PAF so they may have been sampled. These were recorded as ineligible addresses by the interviewers, although interviewers were asked to call at the sampled address in order to check that no private household could be found at the address.

The version of the small user PAF used for selecting the sample is up-dated twice yearly and is specially adapted for use by ONS. The adaptation involves adding information from the Central Postcode Directory (CPD) held at ONS. Examples of the information added are Local Authority codes, wards, grid references and data from the census. A match is also made with the National Health Service Users Postcode

Directory (NHSUPD), also held at ONS, in order to add Health Authority codes. Addresses previously sampled for the NTS or for any other ONS social survey cannot be sampled for a period of three years.

2.2.2 Sampling procedures

In order to select the appropriate number of addresses, a stratified multi-stage random probability sample was used. There were two stages in the sample selection - the sampling of primary sampling units (PSUs) followed by the sampling of addresses within the selected PSUs. The PSUs were in the form of individual or groups of postcode sectors which contained an average of about 2,900 delivery points. Postal sectors south of the Caledonian Canal with less than 500 delivery points were grouped with contiguous sectors so that the minimum size of a group was 500 delivery points. The minimum size of a group of sectors north of the Caledonian Canal was 250.

Postal sectors covering Scottish Islands and the Isles of Scilly were excluded, as in other major Government surveys (see Table 2.1). The effect of this was to exclude 2.2% of the delivery points in Scotland, and about 0.2% of delivery points in the whole of Great Britain.

The sample is drawn annually. 240 PSUs were selected in total in 1998, 20 per month; 21 addresses were drawn from each selected PSU.

A way of increasing the precision of a random sample is to stratify it. Before any selection takes place, the population is divided into a number of strata; then a random sample is selected independently within each strata. This ensures that different strata in the population eg. regions, are correctly represented. This will also lead to a reduction in standard error.

The 1998 NTS sample was stratified using a regional variable and two PSU-level variables derived from the 1991 Census. The regional variable divides Great Britain into 18 regions defined by the nine Standard Statistical Regions of England and Wales, with the former Metropolitan Counties and inner and outer London separately identified, together with the Central Clydeside Conurbation and the remainder of Scotland (Table 2.2).

Table 2.1 Areas omitted from the sample

Region	ONS code and Local Authority name	Name of areas excluded
Southwest	15UH Isles of Scilly	Isles of Scilly
Scotland	71UE Lochaber	Mallaig, Inverie, Soay, Eigg, Muck, Rhum, Canna.
	78UH Cunninghame	Arran, Great/Little Cumbrae.
	71UH Skye/Lochalsh	Whole authority.
	78UP Argyll/Bute	Bute, Oban/neighbouring islands, GighaIslay, Jura/ Colonsay, Mull(pt).
	80UB Orkney	Whole authority.
	81UB Shetland	Whole authority.
	82UB Western Isles	Whole authority.

Table 2.2 The relationship of NTS regions to standard regions

First 2 digits of area code	Standard region
01-02	Greater London
03-04	South East
05	East Anglia
06	Northern (Metropolitan)
07	Northern (Non metropolitan)
08	Yorks and Humberside (Metropolitan)
09	Yorks and Humberside (Non metropolitan)
10	East Midlands
11	Scotland I (Central Clydeside Conurbation)
12	Scotland II (excl. Central Clydeside Conurbation)
13	Northwestern (Metropolitan)
14	Northwestern (Non metropolitan)
15	West Midlands (Metropolitan)
16	West Midlands (Non metropolitan)
17	Southwestern
18	Wales

Within each of the 18 regions the PSUs were ranked in order of the proportions of households with no car and then split into three bands. Within each band the PSUs were ranked in alternate descending/ascending order by the proportion of heads of households in socio-economic groups 1 to 5 and 13 (that is a professional employer or manager). The PSUs were then sampled using a form of systematic sampling to produce a stratified sample.

The number of postcode sectors sampled was fixed in London, but elsewhere, it was proportional to the size (number of delivery points) of the region and was obtained by means of the following formula:-

$$\frac{\text{No. of delivery points in the region} \times 206}{\text{No. of delivery points in GB outside London}}$$

The aim was to give each household outside London an equal chance of selection. In London, the number of PSU selections was fixed at 15 in Inner London and 19 in Outer London. This 'over-sampling' in London was carried out in order to provide sufficient numbers for DETR's particular analysis interest in the area, as response rates in London are lower than elsewhere.

In Great Britain as a whole around 24 million delivery points were available for possible selection with just under three million delivery points in the Greater London area. This means that nationally there was a one in 4,906 chance of an address being selected in the year; in Inner London a one in 3,664 chance of selection, and in Outer London a one in 4,452 chance.

If there is more than one household or business receiving mail at an address an adjustment will need to be made. The Post Office attaches an indicator (the Multi Occupancy Indicator or MOI) to show this. The MOI is intended to indicate the number of 'letter boxes' at the address. A shop with a flat above may have an MOI of two. In general, an MOI of three or more indicates a multi-household address. However, methodological work conducted within SSD has shown that this is only reliable in Scotland.² So in Scotland, addresses with an MOI of three or more were given a chance of selection equal to the MOI. In England and Wales the standard SSD multi-household procedures were used at addresses found to contain more than one household in order to ensure that all households were given an equal chance of selection.³ These procedures were carried out by interviewers at the fieldwork stage. All SSD interviewers are carefully trained in the use of these procedures the details of which are described in Section 2.3.

2.2.3 The allocation of PSUs to interviewer quotas

To reduce unnecessary travelling between addresses by the interviewers, all the addresses selected in a PSU were allocated as a single quota of work for an interviewer. In order to obtain a nationally representative sample for each quarter of the year the PSUs were allocated to quota months such that:

- a total of 20 selections were assigned to a month
- the correct number of PSU selections were made in each major stratum over the year
- the number of PSUs selected per major stratum was as equal as possible from month to month.

A listing of the PSUs allocated to each of the twelve quota months can be found in Appendix C.

2.3 Field sampling procedures

2.3.1 Multi-household procedures

Section 2.2.2. mentioned that the 1998 NTS used the standard SSD multiple-household procedure to ensure that all households at multi-household addresses had an equal chance of selection. These procedures were the:

- pre-sampled multi-household procedure
- concealed multi-household procedure.

These procedures are described in full in the NTS Interviewer Instructions. The key points are summarised below.

The pre-sampled multi-household procedure

The pre-sampled multi-household procedure was used at addresses in Scotland with a Multi Occupancy Indicator (MOI) of more than two. Interviewers were instructed to use a selection grid which will select 1 in n households (n being the value of the MOI). Occasionally a pre-sampled multi-household address contained fewer households than the value of the MOI. In such cases, no household would be selected; the selection grid would indicate to the interviewer that no interview was to be completed at the address and the interviewer would return the address as 'directed not to sample any household at the address'.

The concealed multi-household procedure

The concealed multi-household procedure was used where interviewers came across multi-household addresses in England and Wales, and also at addresses in Scotland with an MOI of one. At these addresses interviewers were instructed to include all households up to a maximum of three. At addresses with more than three households interviewers used concealed multi-household selection grids to select three from the number present.

To limit the extent to which an interviewer's quota could be inflated by the occurrence of several concealed and/or pre-sampled multi-households, interviewers were instructed to interview at no more than four extra households from concealed and/or pre-sampled multi-household addresses. This approach may have introduced a very slight bias against households in concealed multi-household addresses but the effect of this is likely to be negligible.³

2.3.2 Ineligible addresses

Three types of addresses were classified as ineligible for the NTS:

- Non-residential addresses and institutions (ie. residential addresses that did not contain a private household). An institution was defined as: 'an address at which four or more unrelated people slept; while they may not have eaten communally, the establishment must have been run by a person (or persons) employed for this purpose, or by the owner'. Private households with separate accommodation within an institution were included in the survey.

- Residential accommodation not used by a household as their main address (eg. a holiday home or second home). This group was excluded to avoid double counting - households occupying these accommodation had already had a chance of selection at their permanent address.
- Addresses in the PAF that did not exist because they had been demolished, not yet been built, or perhaps two converted flats had been recombined into one house.

2.4 Calculation of sampling errors

The NTS analysis system contains two variables used for the calculation of sampling errors. The five digit area number can be used to arrange the PSU selections in the correct order, the first two digits giving the major stratum and the second three the PSU selection. Then to obtain sampling errors one applies the formula of successive differences within major strata as described in A Sampling Errors Manual by

Bob Butcher and Dave Elliot (OPCS 1987), section 3.3, in particular part 3.3.2(ii).

Some examples of sampling errors were calculated for 1995/97 variables and are given in the 1997 NTS Technical report.⁴

2.5 PSU level variables

Fourteen of the survey variables were measured at PSU level (P level). A value on a P-level variable applies to all households living within that PSU. The P-level is therefore the highest level at which the data of the continuous survey may be analysed, coming just above the H (Household) level in the analysis hierarchy. Unlike almost all other variables in the survey, the PSU variables were not derived from information provided by members of the sampled households. Details on the derivation of the variables are given in Table 2.3. A detailed description of the PSU-level variables is given in the 1997 NTS Technical Report⁴.

Table 2.3 Description of the P-level variables

Variable	Description
P1	The Area Number - identification number for the PSU laid down in the sample design.
P2	Describes the category of planning region (Scotland, Wales and the eight Standard Statistical Regions of England).
P3 - P4	Left blank for the use by DETR.
P5	Type of area - P5 was constructed from a classification of urban areas derived by ONS and DETR from the 1991 Census of Population.
P6	PSU population density derived from population density figures supplied by ONS.
P7	Local authority population density derived from population density figures supplied by ONS.
P8-P14	This information was obtained by DETR from a questionnaire sent to all local authorities in Great Britain in 1995/96. ¹
P8	Availability of concessionary bus fares schemes for pensioners.
P9	Eligibility for concessionary bus fares schemes for pensioners.
P10	Type of concessionary bus fares schemes for pensioners.
P11	Membership fee for concessionary bus fares schemes for pensioners.
P12	Times available for concessionary bus fares schemes for pensioners.
P13	Geographical area covered by the concessionary bus fares schemes for pensioners.
P14	Additional modes of public transport covered by the concessionary fares scheme for pensioners.

¹ 'Concessionary fare schemes in Great Britain in 1995/96', DETR (1997).

Notes

1. The characteristics of the PAF as a sampling frame are described in the paper 'An evaluation of the PAF as a sampling frame and its use within OPCS' Wilson P and Elliot D, *The Journal of the Royal Statistics Society Series A* (1987).
2. 'Multi-household procedures for social survey', Barton J, *Survey Methodology Bulletin No. 40* (1997) ONS.
3. 'Office and field procedures for dealing with multi-household addresses', Dodd T, *Survey Methodology Bulletin No. 5* (1979) ONS.
4. National Travel Survey Technical Report, 1997, Stephanie Freeth et al, ONS, 1999

Chapter 3 Field Work procedures and response

3.1 Introduction

The 1998 NTS was a continuous survey with interviewing occurring every month of the year. In addition to the interview, all respondents were asked to keep a record of their travel over seven consecutive days. The travel recording period for each month (the quota month) ran from mid-month to mid-month (Table 3.1). Field work for each quota month of the survey started at the beginning of the month when interviewers contacted households to complete the interview and “place” the travel records and was completed at the end of the following month when all the travel records had been collected and transferred by the interviewer to the computerised Journey Input System.

Since October 1994 the NTS interview has been conducted using Computer Assisted Personal Interviewing (CAPI). Blaise 3, a software system developed by Statistics Netherlands was used to write the 1998 questionnaire. On NTS, the household, individual and vehicle sections as well as the administration details were incorporated into a single Blaise data model. The Journey Input System was written in the database language ‘Clipper’ which was also used for data handling purposes by SSD. Both systems cross-referenced one another.¹

3.2 Questionnaire discs and despatch of documents to interviewers

Each month the sampled address lists and paper documents, such as the travel records, were despatched to the relevant interviewers from ONS. Computerised details of the addresses to be interviewed were created and then transmitted to the interviewers via a system of direct communication using modems and dedicated telephone lines. Floppy discs containing the CAPI questionnaire were compiled and posted from ONS.

Technical queries from interviewers regarding the transmission of data were dealt with by a special unit set up to deal with such matters. Laptop maintenance was handled by a separate support unit.

3.3 Public Relations

It was important that informants had complete confidence in the survey and in the interviewer. In advance of the interviewer’s call, SSD wrote to each sampled address to inform them of the visit and interview content. For sampled addresses in London, a special ‘London leaflet’ designed to explain the importance of the survey to informants living in that area was also included with the advance letter.² The “London

Table 3.1 1998 quota month end dates

MONTH	From		To	
January*	17	January	16	February
February	17	February	18	March
March	19	March	17	April
April	18	April	18	May
May	19	May	17	June
June	18	June	17	July
July	18	July	17	August
August	18	August	16	September
September	17	September	16	October
October	17	October	16	November
November	17	November	18	December
December	19	December	17	January

* The survey year ran from mid-January 1998 to mid-January 1999.

leaflet” was introduced to encourage more people to take part in the survey in an area where it was relatively more difficult to achieve a high response.

As with all other ONS surveys, the advance letter informed households at the selected addresses that the survey was not compulsory and relied on voluntary co-operation. Informants were also told that any information they gave would be treated in the strictest confidence.

Interviewers were notified of any refusal made to ONS headquarters as a result of the advance letter. These “headquarters refusals” were included in the overall refusal rate but did not count against the interviewer on the individual interviewer response scores.

Before going into the field all ONS interviewers were issued with a photo identification card. Informants had the opportunity to call ONS headquarters to establish the validity of any interviewer.

3.4 Administering the placement pattern

The day on which a sampled household was to start the seven-day travel record keeping (the travel week) was fixed in advance to ensure an even spread of travel weeks throughout the month. This placement pattern had to be adhered to fairly rigidly because travel behaviour is more variable than most other activities. Since October 1995 the assignment of addresses to travel weeks was controlled by the Computerised Allocation System (CAS) which automatically allocated the 21 addresses in an interviewer’s quota to individual dates throughout the quota month according to set rules (see Section 3.5).

However, under the following circumstances the travel week could be altered and reallocated:

- when no contact with the address had yet been made;
- where there had been contact with the household but one or more individuals were not available for interview before commencement of the original travel week;
- where the household was reluctant to co-operate at the initial contact and perseverance at that point may have precipitated a refusal.

To avoid introducing bias into the reallocation of addresses interviewers were instructed to view reallocations as exceptional cases and reallocations were not allowed once the interviewer had mentioned the travel week because it was feared that informants might have wanted to choose an easy or interesting

travel week if this was allowed. The rules governing postponement are described in the next section.

3.5 Computerised Allocation System

The Computerised Allocation System (CAS) automatically allocated sampled addresses to pre-specified travel weeks according to the rules of the survey. Initially, each of the 21 addresses in a quota was allocated a different seven-day travel week. The travel week for an address was determined by i) the day of the week (start day) and ii) the week of the month (allocation period).

Each address had a fixed and unchangeable start day according to its address number. For example:

<u>Address Number</u>	<u>Start day</u>
01,08,15	Sunday
02,09,16	Monday
03,10,17	Tuesday
04,11,18	Wednesday
05,12,19	Thursday
06,13,20	Friday
07,14,21	Saturday

Every quota month consisted of either 30 or 31 days and was divided into four allocation periods (1-4), each consisting of seven or eight days. Five addresses were assigned to three of the allocation periods and six addresses to one of the periods. The period consisting of six addresses rotated between periods 1,2 or 3 according to one of three allocation patterns (A, B or C) selected at random for that quota month.

The system also assisted interviewers with amending the allocation, where necessary, in order to help maintain response whilst still adhering to the rules of the survey, which were:-

- the start day was always the same as in the original allocation;
- there were always at least five and no more than six addresses in each allocation period;
- no two addresses had the same start date.

3.6 The interview

The NTS interview at each household could be divided into a strict sequence of events:-

- the placement call
- the reminder call
- the mid-week checking call
- the pick-up call

The initial interview was carried out at what was termed the ‘placement call’. At this call the interviewer explained the purpose of the survey, ideally to the entire household, and gained the co-operation of the entire household. The interviewer then asked the head of household or partner questions about the household composition, the household’s vehicles and some general background information. Questions were then asked of each individual in the household including children and babies (although for children under the age of 11 the interviewer generally talked to the parent as well as the child). Questions were also asked about each household vehicle from the person best able to give that information (usually the main driver). The interviewer introduced and placed the seven-day Travel Record, and where appropriate, a chart to enter fuel and mileage details for each vehicle in the household and for long distance travel. Interviewers took time to explain in detail how to record journeys made during the travel week and talked the informants through some examples, explaining what to include and what not to include and described the survey definitions, for example, usual place of work, in course of work etc.³ From October 1996, pocket size diaries were occasionally handed out to help informants record details of their journeys. In addition, an NTS pen was left for each household vehicle to aid the completion of the fuel and mileage chart and an NTS fridge magnet was left with each household (for public relations purposes).

When there was a gap of more than a day or two between the placing call and the start of the travel week, the interviewer made a reminder call, either by telephone, post or in person to the household. Interviewers were encouraged to make the call in person where they were concerned about a particular household’s commitment to diary keeping.

Sometimes the interviewer would make an additional mid-week checking call on a household part way through the travel week to help with problems and encourage accurate record keeping. This call was made at the interviewer’s discretion when she/he judged that informants needed encouragement or assistance with record keeping. Again, interviewers were encouraged to call in person.

Pick-up calls were made within six days of the end of record keeping. Interviewers were instructed to target households where they were uncertain of the informant’s ability to maintain accurate records and make those pick-up calls within one or two days of the end of record keeping. The interviewer collected the travel record of each household member and checked the contents with the informant. The interviewer also asked some additional questions about any vehicles acquired since the placement interview, whether a

provisional or full driving licence or season ticket had been acquired and also about any long distance journeys made between placement and the start of the travel week. These questions were also asked using a Blaise CAPI questionnaire. Fuel and mileage charts were also collected and information about vehicle mileage and fuel gauge details were entered into the CAPI questionnaire either during the pick-up interview or later, by the interviewer at home.

After the pick-up call a leaflet explaining the survey was left with the household.

3.7 The 1998 NTS questionnaire

3.7.1 Questionnaire structure

The structure of the 1998 questionnaire is set out in Figure 3.1. A maximum of 10 people, 10 vehicles and 40 long distance journeys per person could be included in any one household interview. When an interviewer encountered a household larger than this a second household would have been opened and the data stored separately to be merged after structure checking, back at the office.

The NTS continuous dataset is usually analysed in three year periods (1989/91, 1992/94, 1995/97), so it has been convenient to introduce new variables at the start of each new three year period, in 1992, 1995, and 1998.

The text of the 1998 questionnaire is set out in Appendix A. The key differences between the 1998 and 1997 questionnaires are set out below.

Household level questions:

- Reinstatement of the questions on access to amenities (doctor’s surgery, post office, prescription chemist, grocer shop, main shopping and general hospital) on foot and by bus (questions *DocWalk* to *HospBus*). These questions were last asked in 1991.
- Adoption of the “harmonised vehicle questions” published in the Government Statistical Service booklet on harmonised concepts and questions for government social surveys.⁴ These questions were introduced to help users compare NTS data with those from the other government social surveys. Additional questions (*CarType* to *OthType* and *CompCar*) were added to provide the detailed information DETR required on each vehicle in the household.

Figure 3.1 The structure of the questionnaire

Section	Subject
Household	Household box. Placement and Travel Week dates. Background questions. Availability of public transport. Access to amenities Number of household vehicles. Vehicle Grid.
Individual	Who interviewed and in what order. Disability section. Frequency of use of various methods of transport Driving licences and type of vehicle driven. Employment, Occupation and Industry details, Income. Place of work and travel to work. Season ticket details. Any long distance journeys made. Long distance journey information. Recall question.
Vehicle	Introduction. Registration details. Parking. Vehicle subsidies. Mileage. Pick-up questions from fuel and mileage chart.
Admin. block	Calls and contact information. Occupation, Industry and Outcome coding. Reasons for refusal.
Journey input and editing system	Journey data input and error checking program.

- Deletion of the questions for identifying the household members who had first and second access to the household vehicle(s).
- Adoption of the “harmonised” questions on age (*Age*), length of residence at the sampled address (*Hlong*) and tenure (*Ten1* to *Furn*)⁴ to improve comparability of NTS data with the data of other government sponsored social surveys.

Individual level questions:

- Reinstatement of the questions on frequency of use of buses, coaches, trains, taxis, bicycles and domestic flights (*OrdBus* to *Plane*). These questions were last asked in 1991.
- Introduction of questions to identify whether the respondent’s usual place of work is an

office, factory or something else (*WkType* to *NewType*), to collect information about the provision of bicycle parking facilities at work (*WkBike*) and to obtain insight into the extent of home working by people who normally travel to work (*WkHome* to *Modem*).

- Adoption of the “harmonised” questions to collect the respondents’ employment details such as economic status, occupation, industry to which the employer belonged and whether worked full time or part time (*Wrking* to *FtPtWk*).⁴

Vehicle level questions:

- Introduction of questions to gauge the extent to which the vehicle was used to carry goods in a year (*GoodsWk* and *GoodsKm*).

3.8 Post interview coding and checking

After collecting the information and material from households at the pick up call, interviewers transferred the data from the travel records into the computerised Journey Input System, coded the occupation, industry and socio-economic group of each informant aged 16 and over and the interview outcome for each household.

3.8.1 Transferring the data from the travel records

At the interviewer's home the data from the travel records were transferred to the Journey Input System written in the database language Clipper. This was basically a straightforward data entry operation where the information was simply copied across onto the interviewer's laptop computer. The system was designed to match the travel records layout exactly. Any inconsistencies identified at this stage were corrected by the interviewer, if necessary checking with the informant. The interviewer then ran the journey checking program comprising pre-specified consistency and plausibility checks and made appropriate amendments, again checking back with informants where necessary or referring to coding instructions.

3.8.2 Timelines

At any stage during the journey input and checking process interviewers could access the NTS 'Timelines' to obtain a graphical display of journey data. Timelines was developed jointly by SSD and the University of Westminster Transport Studies Group for SSD applications such as the NTS. The program displayed each day of travel for each household member in the form of a continuous time line running from left to right across the laptop screen. Each journey was numbered and start, duration, and end times were shown. The journey purpose code was displayed so interviewers could see how long an individual spent on a particular activity (Figure 3.2).

Timelines enabled interviewers to obtain a complete picture of a household's travel patterns on one screen.

It showed each individual in the household for the whole of the travel week or all household members on any one day of the travel week. Timelines could also be used to display journeys for individuals who travelled together on a particular day. At a glance, interviewers were able to see the household's journey structure and identify errors or gaps in the data, including some which it may not have been possible to identify in the journey checking program. For example, a person may have left home for work at the same time every day but on one day left later than usual. The checking program did not identify this as an error or a plausibility query because such checks would have generated an enormous number of error messages. However, such possible inconsistencies were easily visible in Timelines. It therefore provided a useful tool for assuring and improving data quality.

Timelines could also be used as an editing tool back in the office. Editors could immediately obtain a visual picture of a household's complex travel movements across the whole of the travel week before they begin editing.

3.8.3 Socio-economic group and industry coding

The occupation of informants aged 16 or over and who had ever worked were coded using the Standard Occupational Classification (SOC) (1990). Industry information was coded using the Standard Industry Codes (SIC) (1992). Details of the classifications are set out in Table 3.2.

The NTS used the standard SSD closed census matrix which derives Socio-economic Groups (SEG) and Social Class from the standard occupation (SOC) and employment status codes. Where the combination of SOC and employment status was invalid, eg. self-employed policeman, the matrix would impute the 'most likely' SEG and social class according to standard priority rules. A signal in the Blaise instrument indicated when the combination was invalid. If the signal was suppressed by the interviewer, SEG and social class would be automatically imputed.

Figure 3.2 Timeline

3.8.4 Coding the outcome for each household

Households eligible for interview were divided into 3 categories for outcome coding purposes: fully co-operating households, partially co-operating households and non-responding households.

A household was coded as 'fully co-operating' if there was complete journey information for each individual in the household and the bulk of the rest of the information was present. The majority of all of the following sections should have been completed:

- the household section
- an individual section for each person listed in the household box
- a vehicle section for each vehicle listed in the vehicle grid
- all journeys for each person entered into the journey input system and checked fully.

A 'partially co-operating' household must have had at least a household questionnaire completed. A household would be included as 'partially co-operating' if any journeys were missing.

An eligible household was said to be 'non-responding' if the household had refused to take part in the survey or the household was away for the whole of the interviewing period and the interviewer was unable to make contact.

Interviewers also had to assign an outcome code (Table 3.3) to the households they had classified as ineligible using the criteria set out in Section 2.3.2. The code the interviewer would assign to an ineligible household was dependent on the reason for its ineligibility.

3.8.5 Interviewer query service

In the past one person would have closely supervised the office editing process thereby minimising coding and editing bias. Under CAPI interviewers carried out the editing procedure. In order to reduce variability and possible bias among interviewers a service was provided whereby interviewers could report queries relating to survey definitions or coding. The queries were handled by the NTS field co-ordinator who could obtain an overview of all interviewers' work. Any queries not covered by the instructions were referred to the research officer and displayed on the NTS electronic bulletin board. If necessary, the research officer would contact DETR. The query service therefore ensured that central control was maintained over editing decisions.

3.9 Response

Tables 3.4, 3.5 and 3.6 show the national response rate for the period mid-January 1998 to mid-January 1999 and the London response rate for the same period, respectively.

Table 3.2A Socio-economic group

Description	Code

Table 3.3 List of outcome codes

OUTCOME	Outcome codes
FULLY CO-OPERATING - all diaries present	11
PARTIALLY CO-OPERATING - interview at household level but:	
- non contact with one or more elements	21
- refusal by one or more elements	22
- incomplete travel diary for one or more persons	23
REFUSAL	
- refusal to HQ letter	31
- refusal at introduction/before interview	32
- no interview - contact incapable / language problems	34
NON-CONTACT	
- no contact with any household member	41
- household away all field period	42
INELIGIBLE	
- no trace of address	51
- not yet built/under construction	52
- demolished/derelict	53
- vacant/empty/being refurbished	54
- non-residential/business only	55
- institution	56
- temporary accommodation/second home	57
- household contains only foreign diplomats or foreign servicemen living on base	58
- directed not to sample any household at the address	59
- household limit on quota (4) already achieved	

During 1998 the NTS maintained a response rate nationally of 65%. The response rate achieved in the Inner and Outer London areas were 42% and 56% respectively. The DETR measured response according

to Achieved Sample Rates (ASRs) which included sampled addresses classified as 'ineligible' in the denominator. Achieved sample rate calculations are also shown in the Table 3.4 to 3.6.

Table 3.4 1998 NTS response figures: Great Britain

	Achieved Sample Rates			ONS Response Rates	
	No.	%		%	
Set sample	5040				
Additional households	55				
Total dealt with	5095	100			
Ineligible	560	11			
Eligible households	4535			100	
Fully co-operating	2946	58	89%	65	
Partially co-operating	370	7		8	
Refusal to co-operate	1048	21		23	
Non-contact	169	3		4	
Data lost due to laptop problems	2				

Note: The response figures were produced from the ONS Fieldwork Case Management System and may differ slightly from the final figures on the analysis database. Percentage figures may add up to 99% or 101% because of rounding.

Table 3.5 1998 NTS response figures: Inner London

	Achieved Sample Rates			ONS Response Rates	
	No.	%		%

Partially co-operating	34	8		9
Refusal to co-operate	110	27		30
Non-contact	17	4		5

Note: The response figures were produced from the ONS Fieldwork Case Management System and may differ slightly from the final figures on the analysis database. Percentage figures may add up to 99% or 101% because of rounding.

Notes

1. A detailed description of the conversion to Computer Assisted Personal Interviewing and the development of the journey input and editing system is given in Chapter 3 of the 1994 NTS Technical Report.
2. A copy of the London Leaflet is reproduced in Appendix B.
3. All the NTS definitions are set out in the NTS Definitions Manual.
4. *Harmonised Concepts and Questions for Government Social Surveys*, Government Statistical Service, 1996, London, ONS and *Harmonised Concepts and Questions for Government Social Surveys – update December 1997*, Government Statistical Service, 1998, London, ONS.

Chapter 4 Data Processing

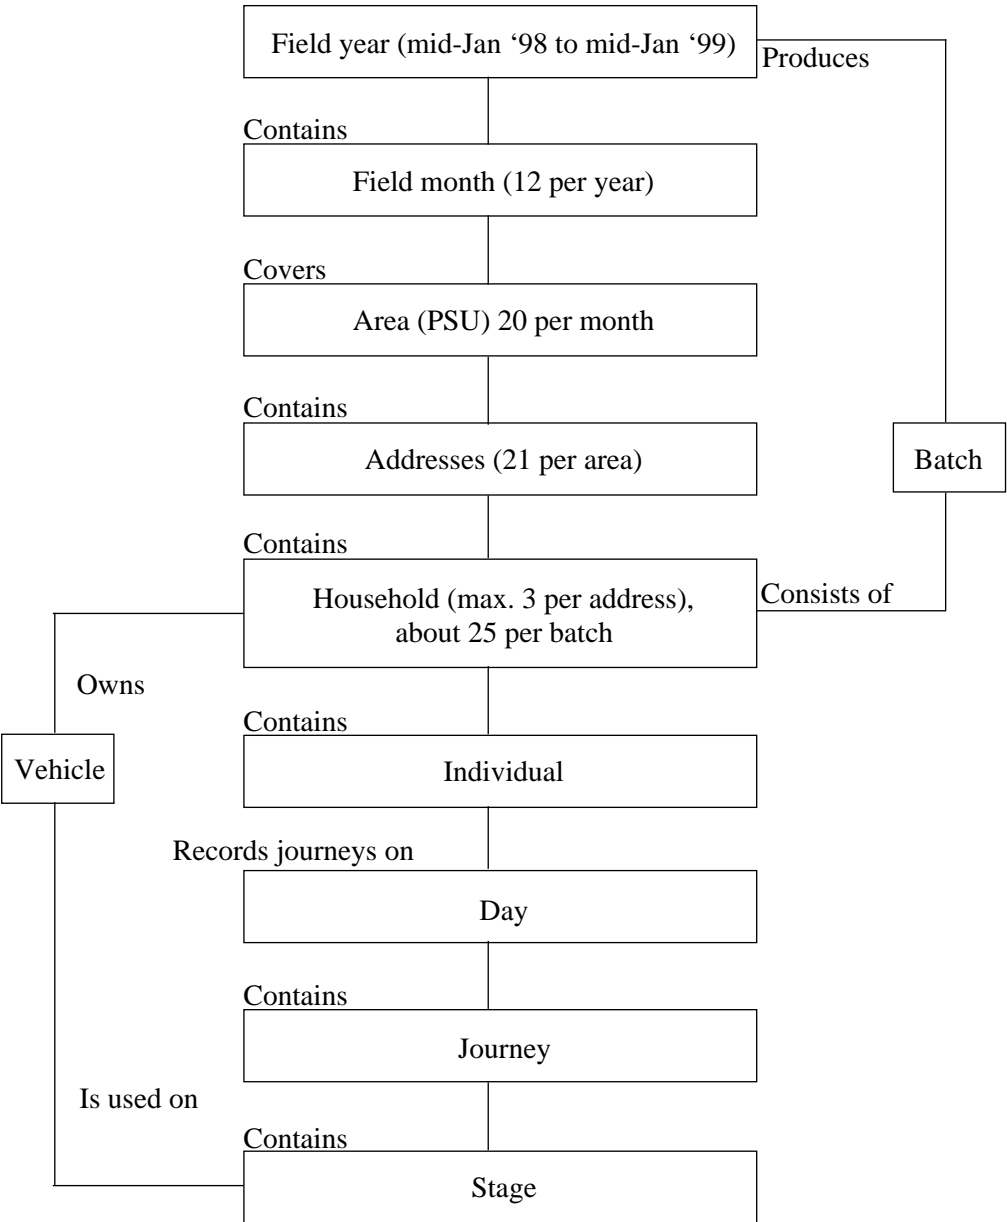

4.1 Data transmission and despatch of paper documents from interviewers

On a weekly basis interviewers transmitted data to ONS. To ensure security, the data were encoded before transmission. Any paper documents were posted to ONS at the end of the field period. The final transmission and posting date was the 28th of the month in which field work was completed.

4.2 Downloading and structure checking

In order to download data transmitted by interviewers into a single dataset a program was run which unzipped, aggregated and added interview data together. A procedure for checking the data was then implemented. This procedure checked for blank, deleted and duplicated records and reported errors. It also carried out structure checking of the data to make sure that journey information had been coded in accordance with the household outcome coding. Data structure details are set out in Figure 4.1.

Figure 4.1 Data structure

4.3 Data editing

Following the move to CAPI, almost all of the old paper editing system was incorporated into the CAPI program and carried out by interviewers. Some follow-up work was, however, conducted after ONS had received the transmitted data using a separate Blaise program. A brief description of the in-house coding and editing procedure is given below. Further details of the checks and coding carried out by the editing staff are given in the NTS headquarters editing instructions.

4.3.1 Interviewer's notes and suppressed checks

At any time during the interview interviewers were able to open a note using the Blaise note book facility. All interviewer notes created in this way were printed on the NTS fact sheet accompanying each household. Most notes contained an explanation of why an interviewer had suppressed a particular error message and may not have required any action from the HQ editor. However, sometimes interviewers may have been unsure about how to code a question, for example, the type of season ticket or area travel card used, and would record the name of the ticket and further details in the Blaise notebook. The editors were then able to check the interviewer's coding or recode if necessary.

4.3.2 Coding

i) Re-coding

Wherever the interviewer had recorded an 'other specify' answer the editor would be required to either re-code to one of the pre-specified answers or leave in the 'other specify' category. A decision would be made based on information recorded by the interviewer in the Blaise note book or in a separate text variable.

ii) Make and model coding

Where a particular vehicle make and model was 'not listed' in the make and model coding frame editors were required to allocate a code back in the office.

iii) Fuel tank size coding

The fuel tank size for most vehicles was automatically coded using the vehicle's make and model information. Editors were only required to enter the exact size of the vehicle's fuel tank for vehicles not listed in the make and model coding frame or if the informant had been unable to provide the information.

iv) County coding

Where interviewers had been unable to allocate a county code, for usual place of work or journey origin and destination, editors were required to allocate the correct code.

4.4 Data conversion

The data was organised into seven record types according to the requirements of DETR (Table 4.1): households, individuals, vehicles, whether made long distance journeys, long distance journeys details, journeys and stages. Missing values were interpreted as 'no answers' (-8) and 'does not apply' (-9). Final checks were made by ONS research staff at the aggregate level using SPSS to ensure the accuracy of the data. The files were then converted to ASCII format and posted to DETR on disc.

Table 4.1 Record types

Record type	Data	Level
Record 1	Households	Household
Record 2	Individuals	Individual
Record 3	Vehicles	Vehicle
Record 4	Whether made long distance journeys	Individual
Record 5	Long distance journeys (LDJ) made before the Travel Week	LDJ
Record 6	Journeys made during the Travel Week	Journey
Record 7	Stages of journeys made during the Travel Week	Stage

1..12

ASK IF: HLong = less than 12 months

OldAdd Is your (is ^LDMIntName)'s old
address more than one mile from here
or less than that?

- (1) More than one mile
- (2) One mile or less

QTenure

ASK ALWAYS:

Ten1 In which of these ways do you occupy this accommodation?
SHOW PROMPT CARD AA MAKE SURE ANSWER APPLIES TO HoH (^DMNAMES[LDMHoHnum]) (HELP<F9>)

- (1) Own outright
- (2) Buying it with the help of a mortgage or loan
- (3) Pay part rent and part mortgage (shared ownership)
- (4) Rent it
- (5) Live here rent-free (including rent-free in relative's/friend's property; excluding squatting)
- (6) Squatting

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Tied Does the accommodation go with the job of anyone in the household?

- (1) Yes
- (2) No

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

LLord Who is your landlord?... (HELP<F9>) CODE FIRST THAT APPLIES

- (1) the local authority/council/New Town Development/ Scottish Homes
- (2) a housing association or co-operative or charitable trust
- (3) employer (organisation) of a household member
- (4) another organisation
- (5) relative/friend (before you lived here) of a household member
- (6) employer (individual) of a household member
- (7) another individual private landlord?

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Furn Is the accommodation provided: ... (HELP<F9>)

- (1) furnished
- (2) partly furnished (eg carpets and curtains only)
- (3) or unfurnished?

QLocServ

ASK ALWAYS:

SatServ [*]
Now I would like to ask some questions about your local bus services. By local I mean services which operate near your home. How satisfied are you with your local bus services?

SHOW PROMPT CARD A

- (1) Very satisfied
- (2) Fairly satisfied
- (3) Neither satisfied nor dissatisfied
- (4) A little dissatisfied
- (5) Very dissatisfied
- (6) Don't use buses

ASK ALWAYS:

EncRage Would you be encouraged to use local buses more often if improvements were made to the bus services?

- (1) Yes
- (2) No
- (3) Not sure

ASK IF: ((EncRage = Yes) OR (EncRage = NtSure)) OR (EncRage = DONTKNOW)

Improv Which do you think are the main ways in which the services could be improved? Please use this card as a guide and mention up to four.

INTERVIEWER: SHOW PROMPT CARD B.....SEPARATE CODES WITH . OR -

USE <F6> AND PAGE DOWN KEY TO SEE MORE CODES SET [4] OF

- (1) Better provision for the disabled/ elderly
- (2) Better provision for people with young children or heavy shopping
- (3) Cheaper fares
- (4) Boarding point closer to home
- (5) Quicker journey time
- (6) More destinations or routes
- (7) More reliable or punctual services
- (8) More frequent services at weekends
- (9) More frequent evening services
- (10) More frequent day-time services
- (11) Better information about services
- (12) Other (SPECIFY IN A NOTE)

ASK ALWAYS:

BusProv Which is the main type of bus provided locally. Is it...

RUNNING PROMPT

- (1) mainly small buses (mini-buses or midi-buses)
- (2) mainly large buses
- (3) OR an equal mixture of both small and large buses?
- (4) No local bus service

ASK ALWAYS:

NearBus About how long would it take ME to walk from here to the NEAREST bus stop (or place where I could get on a bus)? (I am interested in the NEAREST one even if it isn't the main one you use.)
INTERVIEWER: IF INFORMANT GIVES A RANGE eg. 25-30 MINS THEN CODE LOWEST GROUP ie. 4

- (1) 3 minutes or less
- (2) 4-6 minutes or less
- (3) 7-13 minutes
- (4) 14-26 minutes
- (5) 27-43 minutes
- (6) 44 minutes or longer

ASK ALWAYS:

GetBus How often would I be able to get a bus from that bus stop during the day?

PROMPT AS NECESSARY IF VARIES' TAKE WEEK DAY OFF-PEAK FREQUENCY

- (1) Less than once a day
- (2) At least once a day
- (3) At least once an hour
- (4) At least once every half-hour
- (5) At least once every quarter-hour

ASK ALWAYS:

NearSta Now thinking of your local train service, how long would it take ME to walk to your nearest railway (that is, ex-BR) or underground station? Again it is the NEAREST one I am interested in, even if it is not the main one or the one you use.

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK IF: ((NearSta IN [min13 .. min44]) OR (NearSta = DONTKNOW)) OR (NearSta = REFUSAL)

BusSta Can I just check....
How long would it take ME to get to the station by bus?
Include walking to and from the bus stop but assume there is no waiting time.

- (1) No bus service/quicker to walk
- (2) 6 minutes or less
- (3) 7-13 minutes
- (4) 14-26 minutes
- (5) 27-43 minutes
- (6) 44 minutes or longer

ASK ALWAYS:

DescTa Would you tell me which description is most like your nearest railway (or underground) station? Is it a...

RUNNING PROMPT:

- (1) station with frequent services throughout the day (at least once per hour)
- (2) station with frequent services only during rush hours (at least once per hour)
- (3) or a station with less frequent services?

QAmenity

ASK ALWAYS:

IntroA I would now like to ask you some questions about how long it would take to WALK from here to each of the following places.

PRESS 1 TO CONTINUE

1..1

ASK ALWAYS:

DocWalk How long would it take ME to walk to your doctor's surgery?

IF TOO FAR TO WALK, CODE AS '44 MINUTES OR LONGER'

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK ALWAYS:

POWalk How long would it take ME to walk to the nearest Post Office?

IF TOO FAR TO WALK, CODE AS '44 MINUTES OR LONGER'

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK ALWAYS:

ChemWalk How long would it take ME to walk to the nearest chemist to get a prescription?

IF TOO FAR TO WALK, CODE AS '44 MINUTES OR LONGER'

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK ALWAYS:

GrocWalk How long would it take ME to walk to the nearest shop selling groceries?

IF TOO FAR TO WALK, CODE AS '44 MINUTES OR LONGER'

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK ALWAYS:

- (3) on the street/public highway,
- (4) or elsewhere (at or near your
home)? (SPECIFY IN A NOTE)
- (5) DOES NOT USUALLY PARK
AT/NEAR HOME

ASK IF: WherePk IN [Street, Other]

HowFar RUNNING PROMPT
Approximately how far from the
boundary of your property is the
vehicle usually parked overnight?
INTERVIEWER: BOUNDARY OF
PROPERTY MEANS NEAREST
ACCESS POINT TO ROAD
e.g. GATE OR DOOR IF NO
GARDEN
FOR THE PURPOSE OF THIS
QUESTION 1 METRE IS THE
SAME AS 1 YARD
NOTE THE LENGTH OF A FORD
ESCORT IS APPROXIMATELY 5
YARDS

- (1) right outside,
- (2) not right outside but less than 10
yards/metres away,
- (3) 10 yards but less than 100 yards/
metres away,
- (4) 100 yards/metres away or more?

ASK IF: HowFar = Less100

HowFar2 How many yards/metres away from the boundary of your property is the vehicle usually parked?

BOUNDARY OF PROPERTY
MEANS NEAREST ACCESS
POINT TO ROAD
E.G. GATE OR DOOR IF NO
GARDEN
A FORD ESCORT IS ABOUT 5
YARDS LONG

10..99

ASK IF: HowFar = More100

HowFrMin How long does it take you to walk from the boundary of your property to the place where the vehicle is usually parked?

GIVE THE ANSWER TO THE
NEAREST MINUTE

1..60

ASK IF: WherePk IN [Street, Other]

IfPay Do you have to make any payment for parking the vehicle in this place?

- (1) Yes
- (2) No

ASK IF: IfPay = Yes

TypePay What is the payment for?

- (1) Residents parking permit
- (2) Other non-residents parking permit
- (3) A hired garage
- (4) Something else (SPECIFY)

ASK IF: TypePay = Other

XTyppay INTERVIEWER: Describe the type of payment made for parking the vehicle

STRING[40]

ASK IF: IfPay = Yes

Annfee How much is the annual parking fee that you pay?
INTERVIEWER: ENTER THE ANNUAL FEE TO THE NEAREST £. IF PAID MONTHLY, WORK OUT WHAT THIS WOULD BE ANNUALLY.

0..997

QComCar

ASK IF: FuelTyp <> Electric

WhoReg (May I just check) In whose name is the ... registered?
INTERVIEWER: UNREGISTERED & YET-TO-BE REGISTERED VEHICLES SHOULD BE CODED TO THE APPROPRIATE OWNER.

- (1) Household member
- (2) Someone outside household
- (3) Employer/firm for whom household member works
- (4) Own business
- (5) Other firm or organization

ASK IF: (WhoReg = OutHH) OR (WhoReg = DONTKNOW)

WhoOwn Who owns the vehicle?

- (1) Household member
- (2) Someone outside household
- (3) Employer/firm for whom household member works
- (4) Own business
- (5) Other firm or organization

ASK IF: (WhoOwn = OutHH) OR (WhoOwn = DONTKNOW)

WhyUse Why do you have use of the vehicle?

INTERVIEWER: INCLUDE AS BORROWED', VEHICLES OWNED BY NON-HOUSEHOLD MEMBER BUT WHICH ARE AVAILABLE FOR USE FOR THE WHOLE OF THE TRAVEL WEEK.

- (1) Borrowed
- (2) Other - specify in a note

ASK IF: (WhoReg IN [OthFirm]) OR (WhoOwn IN [OthFirm])

VehHire Is the vehicle on hire or lease, or not? IF 'NO' SPECIFY WHY NOT IN A NOTE

- (1) Yes
- (2) No

ASK IF: VehHire = Yes

WhoHire Who has hired or leased the vehicle?

- (1) Household member
- (2) Employer/firm for whom household member works
- (3) Own business

ASK IF: (WhoHire = Hhmem) OR (WhoHire = DONTKNOW))

CostHir Are any of the costs of hiring or leasing paid for by the employer of a member of your household?

- (1) Yes
- (2) No

ASK IF: (WhoReg IN [HHmem]) OR (WhoOwn IN [HHmem])

VehCost Were any of the purchase costs of the vehicle paid for by a firm or organization?

- (1) Yes
- (2) No

ASK IF: VehCost = Yes

ComTax95 For some people, having a vehicle means that they have to pay company car tax. Do you have to pay company car tax?

- (1) Yes
- (2) No

ASK IF: Privately owned vehicle AND (((WhoOwn = OwnBus) OR (WhoReg = OwnBus)) OR (WhoHire = OwnBus))) OR (((VehCost <> Yes) OR (ComTax95 = No)) AND (Stat = SelfEmp) AND (HmnDriv = RESPONSE))

CapAll (May I check) Can you claim capital allowances for your vehicle and/or tax refunds for costs of business mileage?

- (1) Yes
- (2) No

ASK IF: (ComTax95 = Yes) OR (CapAll = Yes)) OR (WhoOwn = Firm)) OR (WhoReg = Firm)) OR (WhoHire = Employ))

Assign Does employer/firm/organisation think of this vehicle as specifically 'assigned' to anyone in the household?

- (1) Yes
- (2) No

ASK IF: Assign = Yes

WhoAss To whom has (your firm/the employer,firm,organisation) assigned it?

INTERVIEWER: ENTER PERSON NUMBER FROM LIST OF HOUSHEOLD MEMBERS OR CODE 89 IF ASSIGNED TO MORE THAN ONE PERSON IN HOUSEHOLD

1..89

ASK IF: (Assign = No) OR (Assign = DONTKNOW)) OR (WhoAss = 89)) OR (WhoAss = DONTKNOW)

WhoBus (May I check) Who does the most business mileage in the vehicle?
INTERVIEWER: ENTER PERSON NUMBER FROM LIST OF HOUSHEOLD MEMBERS OR CODE 89 IF ASSIGNED TO MORE THAN ONE PERSON IN HOUSEHOLD

1..89

ASK IF: (DMPRIVCO = Private) AND (Cartype = Wheel4 OR LightVan) AND (IchEmp = Yes)) AND (((WhoReg = HHmem) OR (WhoOwn = HHmem)) OR (WhoHire = Hhmem))) AND (ComTax95 <> Yes))) OR (((WhoReg = OwnBus) OR (WhoOwn = OwnBus)) OR (WhoHire = OwnBus)) AND (CapAll = No))

CourWk95 (May I check) do you/does ... use the vehicle in the course of your work?

- (1) Yes
- (2) No

ASK IF: (DMPRIVCO = Company) OR (WhoOwn = Firm) OR (WhoReg = Firm)) OR (WhoHire = Employer)) OR (ComTax95 = Yes) OR (CostHir = Yes)) AND ((Cartype = Wheel4) OR LightVan)

PrivMi95 (May I check) for your private mileage, including commuting mileage, do you receive any free fuel?

- (1) Yes
- (2) No

ASK IF: PrivMi95 = Yes

FTax95 (May I check) do you pay the tax on free fuel?

- (1) Yes
- (2) No

ASK IF: (DMPRIVCO= Private) AND (WhoOwn = HHmem) OR (WhoReg = HHmem) OR (WhoHire = HHmem) AND (CourWk95 = Yes)) AND (DMVEHTYPE= Wheel4 OR LightVan) AND (IchEmp = Yes)

Allow95 For the mileage 'you' do in course of work do 'you' receive

- (1) a mileage allowance only
- (2) a mileage allowance and some other allowance
- (3) or do you receive nothing and have to pay yourself?
- (4) Other.

ASK IF: (Allow95 = OthAll) OR (Allow95 = Other)

XAllow95 INTERVIEWER: PLEASE DESCRIBE IN DETAIL EXACTLY WHAT KIND OF ASSISTANCE THE INFORMANT RECEIVES FOR MILEAGE DONE 'IN COURSE OF WORK'.

STRING[60]

ASK IF: (WhyUse = Borrowed) OR (VehHire = Yes)

BorHire Is your vehicle borrowed or hired for less than one year or for one year or more?

- (1) Less than 1 year
- (2) 1 year or more

QMileag

ASK IF: (FuelTyp <> Electric) AND (BorHire <> LessYear)

AnMiles I would like to get a figure for the approximate annual mileage of the Can you please estimate for me the total miles the vehicle is driven in a year?

INTERVIEWER: IF DK ENCOURAGE ESTIMATE. IF NECESSARY OBTAIN TO NEAREST THOUSAND. OBTAIN EXPECTED MILEAGE IF VEHICLE ACQUIRED LESS THAN A YEAR AGO. IF NIL ENTER 0

0..99999

ASK IF: AnMiles = DONTKNOW

BAnMiles SHOW PROMPT CARD H
Could you tell me in which of these bands on this card is the approximate total MILES this vehicle is driven in a year?

INTERVIEWER: IF DK ENCOURAGE ESTIMATE. OBTAIN EXPECTED MILEAGE IF VEHICLE ACQUIRED LESS THAN A YEAR AGO.

- (1) 0 - 499 miles
- (2) 500 - 999 miles
- (3) 1,000 - 1,999 miles
- (4) 2,000 - 2,999 miles
- (5) 3,000 - 3,999 miles
- (6) 4,000 - 4,999 miles
- (7) 5,000 - 6,999 miles
- (8) 7,000 - 8,999 miles
- (9) 9,000 - 11,999 miles
- (10) 12,000 - 14,999 miles
- (11) 15,000 - 17,999 miles
- (12) 18,000 - 20,999 miles
- (13) 21,000 - 29,999 miles
- (14) 30,000 miles and over

ASK IF: (AnMiles > 0)

KmOrMile INTERVIEWER ASK OR CODE: WAS THE ANSWER TO ANMILES' IN MILES OR KILOMETRES?

- (1) Miles
- (2) Kilometres

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles) OR (((DMVEHTYPE= Wheel4 OR Lightvan)) AND ((AnMiles <> RESPONSE) OR (KmOrMile <> RESPONSE))))

UsualWk Can you please estimate how many of the total annual miles, if any, are driven by anyone in the household in getting to or from a usual place of work, either all of the way or part of the way?
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles) OR (DMVEHTYPE = Wheel4 OR Lightvan) AND ((AnMiles <> RESPONSE) OR (KmOrMile <> RESPONSE))

CoursWk Leaving aside these journeys, can you estimate how many of the total annual miles, if any, are driven by anyone in the household in the course of work?
IF NIL ENTER 0

0..99999

ASK IF: (CoursWk > 0)

GoodsWk And can you estimate how many of these ^CoursWk miles are driven by anyone in the household whilst carrying goods in the course of work
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles) OR (((DMVEHTYPE = Wheel4 OR Lightvan)) AND ((AnMiles <> RESPONSE) OR (KmOrMile <> RESPONSE))))
AND: (((AnMiles = RESPONSE) AND (UsualWk = RESPONSE)) AND (CoursWk = RESPONSE)) AND (AnMiles >= (UsualWk + CoursWk))

Othmile So that means that the vehicle is driven about ^OtherM miles a year for all other journey's.
ENTER THE NUMBER SHOWN IF CORRECT

0..99999

ASK IF: FuelTyp <> Electric) AND (BorHire <> LessYear))
AND: (IchEmp = Yes) AND (KmOrMile = Km)

UsualKm Can you please estimate how many of the total annual kilometres, if any, are driven by anyone in the household in getting to or from a usual place of work, either all of the way or part of the way?
IF NIL ENTER 0

0..99999

ASK IF (KmOrMile = Km)

CoursKm Leaving aside these journeys, can you estimate how many of the total annual kilometres, if any, are driven by anyone in the household in the course of work?
IF NIL ENTER 0

0..99999

ASK IF: (CoursKm > 0)

GoodsKM ^DMVEH[LTLoooper]

And can you estimate how many of these ^Courskm kilometres are driven by anyone in the household whilst carrying goods
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND (KmOrMile = Km)
AND: (((AnMiles = RESPONSE) AND (UsualKm = RESPONSE)) AND (CoursKm = RESPONSE)) AND (AnMiles >= (UsualKm + CoursKm))

Othkm So that means that the vehicle is driven about ^otherkm kilometres a year for all other journeys.
ENTER THE NUMBER SHOWN IF CORRECT

0..99999

ASK IF: FuelTyp <> Electric) AND (BorHire <> LessYear))

SecCyc May I check about the milometer in the vehicle.
Is the milometer on its second cycle, in other words has it reached its maximum figure and been through zero again?

(1) Yes
(2) No

ASK IF: BorHire <> LessYear

MiloRep Has the milometer been replaced since the vehicle was new?

(1) Yes
(2) No

QTVPickU

ASK IF: (QSignIn.StatusQ = Pickup) AND (WhenAcq <> Aftr)) AND (WhenDis <> Bfore) OR (StillGot = Yes))

FuelNow INTERVIEWER: DO YOU WANT TO COMPLETE THE FUEL GAUGE DETAILS NOW OR LATER?
IF THE FIRST OR LAST GAUGE READING WAS 'FULL' OR EMPTY', YOU MUST CODE NOW' AS YOU WILL NEED TO ASK THE INFORMANT SOME EXTRA QUESTIONS

(1) Now
(2) Later

ASK IF: FuelNow = Now

AnyFuel INTERVIEWER: CHECK FUEL GRID IN FUEL AND MILEAGE CHART, AND CODE WHETHER ANY FUEL WAS PUT IN TANK IN TRAVEL WEEK

(1) Fuel put in
(2) No fuel put in

ASK IF: AnyFuel = Fuelin

LONG DISTANCE TRAVEL RECORD

Between today's date (/ /) and the date on which you begin your travel diary (/ /), you may wish to keep a note of any journeys you make of 50 miles or longer. Our interviewer will be asking a few more questions on these long distance journeys when he/she returns to collect your travel diary.

Journey No.1

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.2

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.3

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.4

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.5

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled

Travel week

START day

FINISH day.....

* Include walks on the first six days if they are a mile or more. Include all walks on the final day.

* Enter every journey you do on any other method of transport (bus, train, car, bicycle etc.)

The interviewer.....
will call again on

DAY	DATE	TIME

HOW TO FILL IN YOUR TRAVEL RECORD

ORIGIN AND DESTINATION

Write down the name of the place where your journey started and finished. We are interested in the actual name of the village or town. (You need only record 'H' or 'W' if the journey started or finished at Home 'H' or Work 'W'.)

METHOD OF TRAVEL

Show each different method on a separate line, eg *car, train, bus*. On the first 6 days include *walk* as a method if it is a mile or more (20 minutes or more). On the final day include *every walk* you do.

TIME TRAVELLING

Give time spent travelling on a bus/train, in a car or walking. Please do NOT include time spent waiting for buses/trains.

COST

Write the amount paid for the actual journey -so for a journey made with a season ticket write *nil*. A journey made with a pass may be free or you pay something. If so, write down the cost.

Purpose of Journey	Time left	Time arrived	From (Village /Town)	To (Village /Town)	Method of travel	Distance (miles)	No. in party	Time travelling (mins)	If BUS, TRAIN, AIRCRAFT (or taxi)		If CAR or MOTORBIKE			Notes
									Cost	No. of boardings	Which car/motorbike used	Dr/Pass (DR,FP or RP)	DRIVERS only: where parked and cost	
1 Go to Shops	10.35	10.55	H	Chester	1 Bus 2	1 1/2	1	15	1 90P	2				
2 Return home	12.15	12.45	Chester	H	1 Bus 2	1 1/2	1	25	2 90P	2				
3 Go to Friends	3.30	3.42	H	Frodsham	1 Car 2	5	1	12	3		Red Renault	DR	on the sheet	
4 Return home	6.15	6.25	Frodsham	H	1 Car 2	5	1	10	4		Red Renault	DR	own property	

PURPOSE OF JOURNEY

We are interested in a simple description such as '*to work*', '*to get home*', '*from work to shops*', '*shopping*', '*take a child to school*' etc. If you are unsure, make a note and the interviewer will sort it out.

NO. IN PARTY

This means the number of people who set out together. To be included in your party a person must be with you for at least 1/2 the distance.

DRIVER/PASSENGER

For journeys by car or motorbike please record whether you were:

the Driver DR
Front passenger FP
or Rear passenger RP

DRIVERS ONLY -

Where parked/cost

We would like to know here if the car/motorbike was parked:

- '*on the street*',
- '*on own/friend's property*'
- '*in a public or firm's car park*'
- '*in a private car park*'
- or '*not parked.*'

Also please record the cost of parking, if any.

1					1 2					1				
2					1 2					2				
3					1 2					3				
4					1 2					4				

Include ALL JOURNEYS BY TRANSPORT (bus, train, car, bike etc). Include walks if 1 mile or more.

DRIVERS: Remember to enter your first milometer and fuel gauge reading on the Fuel and Mileage Chart

										If BUS, TRAIN, AIRCRAFT (or taxi)		If CAR or MOTORBIKE			
Purpose of Journey	Time left	Time arrived	From (Village /Town)	To (Village /Town)	Method of travel	Distance (miles)	No. in party	Time travelling (mins)	Cost	No. of boardings	Which car/ motorbike used	Dr/Pass (DR,FP or RP)	DRIVERS only: where parked and cost	Notes

To help you in recording, here are examples of fuel gauges in two popular models of cars:

Please record the actual level shown. Since some gauges stick on 'full', if your gauge shows 'full' you will be asked if you think the vehicle had done at least 20 miles since fuel was last put in the tank.

And since some gauges show 'empty' when there is still quite a lot of fuel in the tank, if your gauge shows 'empty' you will be asked if you think the vehicle could have done at least another 20 miles before the tank ran dry.

THE NATIONAL TRAVEL SURVEY IN LONDON

To help plan for travelling in the future we need to know about the journeys people make now.

This information is provided by the National Travel Survey which is being carried out by the Office for National Statistics.

Travel is part of our everyday lives and the problems of pollution and traffic congestion are particularly acute in London, the capital city. Travel is different in London and we need your help in understanding how it can be improved for both residents and visitors. Did you know for instance that:

- About 1 million people travel to work in Central London each weekday morning.
- Sixty six per cent of workers in Great Britain usually travel to work in a car, but only 18% of those working in Central London do so.
- The average speed of traffic in Central London during the day is only about 11 miles per hour.
- Fifteen per cent of Londoners' travel is by rail (including the tube), compared with 5% for non-Londoners.
- Public money equal to £5 per person per week is spent on maintaining the capital's roads and helping to provide public transport.

That's Why We Need Your Help to tell us

- How you get to work, to the shops, to schools
- How far you travel
- How often you go on buses, trains, or by car, by bike or walk.

Your co-operation is very important to this project. One of our staff is trying to get in touch with you and will be pleased to answer any questions you have about our work, and to explain how you could help.

1 Drummond Gate
London
SW1V 2QQ

Any information you give will be treated in confidence. The results will not be used in any way in which they can be associated with your name or address.

No identifiable information about you or your household will be passed to other government departments, local authorities, members of the public or the press.

Is the survey confidential?

Yes - any information you give will be treated in confidence. The results will not be used in any way in which they can be associated with your name or address. Apart from statisticians and researchers in ONS and the Department of the Environment, Transport and the Regions no identifiable information about you or your household will be passed to other government departments, local authorities, members of the public or press.

Is the survey compulsory?

No - as in all our surveys we rely on people's voluntary co-operation which is essential if our work is to be successful. By taking part in this survey you are making a contribution that benefits everyone. Your co-operation is very much appreciated.

What is the Office for National Statistics (ONS)?

ONS, is the government department which gathers together and publishes a range of statistics about the society in which we live and about the economy. It is also the Office of the Registrar General for England and Wales.

ONS includes the Social Survey Division which carries out many important government surveys throughout Great Britain, providing information on the cost of living, health, housing and many other matters of public interest.

ONS has a wide range of other responsibilities, including

- the registration of births, marriages, and deaths*

- providing population and health statistics*
- carrying out the census of population*
- providing statistics on employment and unemployment
- providing statistics on businesses, and the nation's finances and economy

If you would like any further information about ONS, please telephone the Central Enquiry point on 0171 533 5500.

* In Scotland these functions are carried out by the Scottish General Register Office.

We hope that this leaflet shows you how important the National Travel Survey is and how the information collected can be of benefit to everybody.

Thank you for helping us.

0171 533 5427/5423/5433

The National Travel Survey

The National Travel Survey is being carried out by Social Survey Division of the Office for National Statistics on behalf of the Department of the Environment, Transport and the Regions.

HA13/4 11/98

What is the survey about?

The government makes many decisions about travel and transport services and to do this it needs up-to-date and reliable information. A sensible way to get this is to ask people themselves about their travel and the National Travel Survey has been doing this since 1965.

The information which you and several thousand other households provide, gives a picture of different kinds of transport people use, distances, where people travel to and from and for what purposes, and what kinds of people travel and how often.

How is the information used?

The National Travel Survey is used to build up a picture of different kinds of traveller such as car users or bus users, and to examine travel among particular groups of people in the community such as the elderly or the disabled. For example, the information collected is used to calculate how many people who are entitled to concessionary fares, actually make use of them. The survey also helps to find out the transport needs of people in getting to work, to the shops, to school, and for social purposes such as visiting friends and relatives.

Because the survey is carried out during every week of the year, changes in travel behaviour and changing needs can be measured. Furthermore it is the only source of national information on subjects such as cycling or

walking, and it contributes to discussions on the environment. The survey also allows estimates to be made of annual vehicle mileage and vehicle fuel consumption.

The main results of the survey are published and so are available to anybody interested in travel and transport.

Some facts and figures from the National Travel Survey

- * Nowadays, people travel nearly four times as far, on average, as they did in 1950.
- * On average people spend about as much on travel within Great Britain, as they do on housing - about 15p in every pound.
- * In 1995/97, the average person spent over 2 weeks (or 1 hour a day) each year travelling within GB. About 9 days were spent in a car, about 3 days were spent walking and 2 days in total were spent on bus and train services.
- * About two thirds of all households in Britain have the use of a car or light van.
- * In 1994/96, adult men travelled over 9,000 miles on average each year compared to less than 6,000 miles for adult women. Children travelled an average of 3,800 miles a year.

- * One car in thirteen (7%) in GB is a company car. In 1995/97, company cars were, on average, driven nearly 22,000 miles compared to just over 8,000 miles for private cars.
- * In 1995/97 on average households spent 13% of their total expenditure on motoring costs. (£41 per week).
- * The average distance walked per person per year fell from 255 miles in 1975/76 to 195 miles in 1995/97, a fall of about 24%.
- * The average distance cycled per person per year fell from 51 miles in 1975/76 to 37 miles in 1995/97.
- * Figures for 1995/97 show that 81% of men and 57% of women held a full car licence compared with 63% of men and 21% of women in 1972.

How was your household chosen?

The households in the survey have been chosen by taking a representative national sample of addresses from the Postcode Address File, that is, the Post Office's own list of addresses. We then approach the people who happen to live at those addresses. To make sure that travelling done by all types of household is properly represented, **it is important that everyone selected helps us by giving the necessary information. To obtain a true picture we need to include people who make a lot of journeys, few journeys, or even no journeys at all.**

About the Office for National Statistics

The Office for National Statistics (ONS) is the Government Agency responsible for compiling, analysing and disseminating many of the United Kingdom's economic, social and demographic statistics, including the retail prices index, trade figures and labour market data, as well as the periodic census of the population and health statistics. The Director of ONS is also Head of the Government Statistical Service (GSS) and Registrar-General in England and Wales and the agency carries out all statutory registration of births, marriages and deaths there.

Editorial policy statement

The Office for National Statistics works in partnership with others in the Government Statistical Service to provide Parliament, government and the wider community with the statistical information, analysis and advice needed to improve decision-making, stimulate research and inform debate. It also registers key life events. It aims to provide an authoritative and impartial picture of society and a window on the work and performance of government, allowing the impact of government policies and actions to be assessed.

Acknowledgements

Thanks are due to the headquarters staff and interviewers in Social Survey Division of ONS whose consistent hard work has led to the success of the survey. Thanks, of course, are also due to the staff at the Department for the Environment, Transport and the Regions for their advice, guidance and support.

Chapter 1 Introduction

1.1 Background

The National Travel Survey (NTS) provides regular, up-to-date data on personal travel and monitors changes in travel behaviour over time. The first NTS was commissioned by the Ministry of Transport in 1965/66. Further periodic surveys were carried out in 1972/73, 1975/76, 1978/79 and 1985/86. In 1988 the NTS became a continuous survey with field work being carried out every month of the year.

Social Survey Division (SSD) of the Office for National Statistics (ONS) carried out the NTS in 1972/73 and 1985/86 and has been the contractor for the continuous NTS since its launch in 1988. SSD is responsible for questionnaire design, sample selection, data collection, data editing and data file production. Analysis and report production are carried out by the Department for the Environment, Transport and the Regions (DETR), the commissioning department for the survey. An edited database is sent to DETR every 3 months and is produced 2 months after the end of fieldwork.

This report describes the methodology of the 1999 NTS. It is intended as a working reference manual and describes the sample design, fieldwork methodology, data production and data file production.

1.2 Uses of the NTS

The NTS provides detailed information on different types of travel; where people travel from and to (at county level), distance, time, purpose and what kinds of people are doing the travelling and how often. The NTS is the only source of national information on subjects such as cycling and walking which provide a context for the results of more local studies.

The results of the survey are published by DETR and are available to users both within and outside Government. Travel research institutes such as the Transport Research Laboratory (TRL) view the NTS as one of their major data sources and the NTS datasets are deposited at the Data Archive at the University of Essex. Details on the use of the NTS are presented in Figure 1.1.

1.3 Sequence of work on the NTS

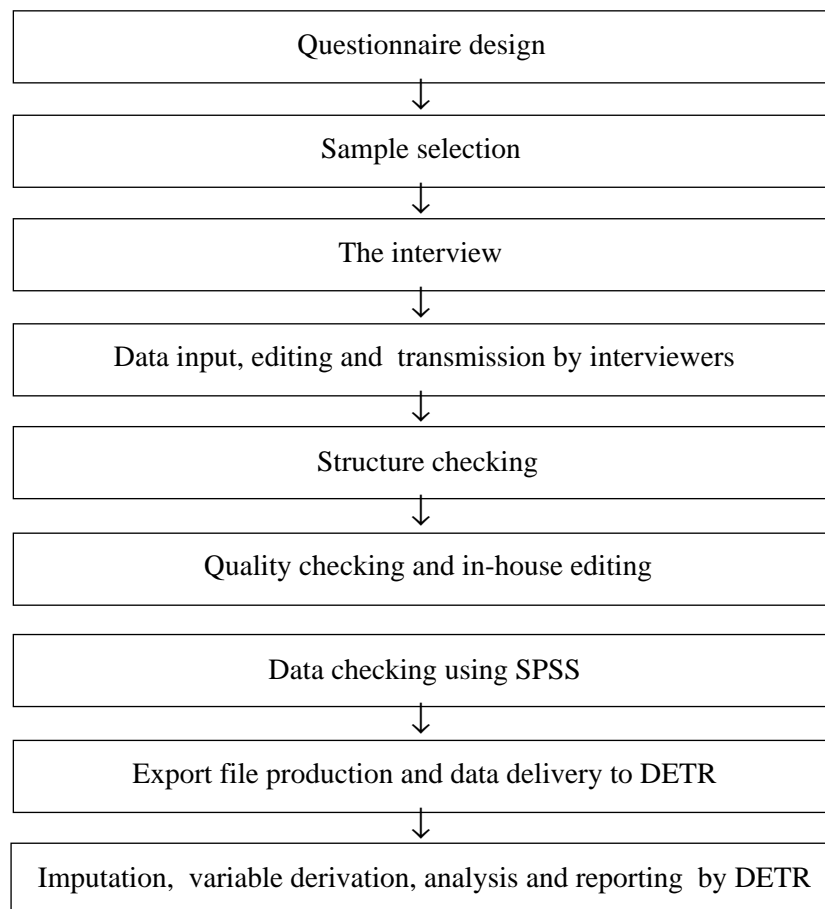

The NTS collects data using two methods: face-to-face interviewing carried out using computer assisted personal interviewing (CAPI) and seven day travel diary keeping. The sequence of tasks carried out on the 1999 NTS is summarised in this section and in Figure 1.2. Details on individual procedures are set out in the remainder of the report.

Figure 1.1 Uses of the NTS

The DETR has used the NTS to:

- build up a general picture of changes in personal travel over time, for all modes including walking, cycling, car and public transport
- examine travel among special groups in the population such as children, the elderly or disabled
- estimate accident rates on the basis of exposure to accident risk for different groups in the population
- establish the level of take up of concessionary fares among those entitled to such fare schemes such as the elderly
- estimate annual mileage for cars (as opposed to other light vehicles such as taxis or vans); this information is used when road tax and fuel tax payments are under consideration
- estimate the effect that a change in this balance of road tax to fuel tax would have on different kinds of households
- examine changes over time in travel for different purposes, such as commuting, business, education, shopping and leisure
- collect information about whether people use leaded or unleaded petrol or diesel in their vehicles
- assess the extent to which tax concessions available to those with company cars encourage extra mileage
- examine the relationship between the level of car ownership and the level of bus patronage at regional level
- examine car ownership levels and the availability of bus services in rural areas.

Figure 1.2 Sequence of work

1.3.1 Sample selection

The NTS is based on a random **sample** of private households. The 1999 sample size was 5,040 addresses drawn from the **Postcode Address File**. The addresses selected were allocated into interviewer quotas in such a way that each quarter's sample was nationally representative.

1.3.2 The interview

In advance of the interviewer's first call, letters were sent to the sampled addresses. These letters introduced the survey and explained that an interviewer would call shortly.

The NTS sampled allocation month ran from mid-month to mid-month. The interviewer would usually start to make contact with the household at the beginning of the calendar month in which the seven day

diaries (travel records) would be kept. A **placement call** would be set up prior to the start of the record keeping week (**travel week**) specified for that household. At the placement call, the interviewer would conduct an interview. After the interview, the interviewer explained the travel record keeping procedure in detail.

The placement call was generally followed by a **reminder call**, just before the start of the travel week, to remind the household to begin their travel records, and by a **midweek checking call** during the travel week to check that the records were being completed correctly.

The interviewer made a **pick-up call** to collect the travel records and to check the information recorded with the informants. A few additional questions were also asked. The pick-up call was made within six days of the end of the travel week. Figure 1.3 summarises the calls made to a household.

Figure 1.3 The interview

1.3.3 Data input and editing during the field work period

Working at home, the interviewer transferred and coded the travel information from the **travel records** to the **computerised Journey Input System**. Any inconsistencies identified at this stage were corrected by the interviewer and, if necessary, checked with the informant.

The interviewer then ran the **journey checking program** (pre-specified consistency and plausibility checks) and made the appropriate amendments, again checking back with informants where necessary or referring to the interviewer instructions.

Throughout the field period SSD staff monitored the progress of interviewer's work and answered coding and technical queries.

On a weekly basis interviewers transmitted data to ONS office. Any paper documents were returned by post at the end of the field period. The final transmission and posting date was the 28th day of the month in which field work was completed.

1.3.4 Final data editing and checking and data file production

The transmitted data were structure checked to make sure that all the data transmitted by the interviewers had been received. All returned paper documents were also checked.

Some final coding and checking was then carried out in the office. Manual recodes and interviewer's notes were scrutinised. Quality checks were also made on selected interviewers on a rota basis.

The data were organised into seven record types and sent to DETR on a quarterly basis. The seven record types consisted of: households, individuals, vehicles, long distance journeys made before start of the seven-day Travel Week (two records), journeys made during the Travel Week and stages of the journeys made during the Travel Week.

1.4 Response

Only households classed as 'fully co-operating' were included in the response calculations.¹ In 1999 a national response rate of 66% was achieved.² Under the current contract, the DETR measures response according to Achieved Sample Rates (ASRs). Unlike the usual SSD response measure, ASRs include sampled addresses classified as 'ineligible' in the denominator.³ In 1999 a national Achieved Sample Rate of 58% was achieved.

Notes

1. See 3.7.4 for a description of the term 'fully co-operating'.
2. The response data in this report are provisional figures produced from the ONS Field Case Management System. They may differ slightly from the final figures on the analysis database.
3. See Section 2.3.2 for the definition of an ineligible address.

Chapter 2 Sample Selection

2.1 The sample requirements

The survey is required to provide a comprehensive picture of personal travel behaviour by people living in private households in Great Britain. The sample was designed to provide a representative sample of households in Great Britain. The NTS has an annual two-stage set sample of 5,040 addresses with each member of each household providing information about journeys made in a pre-selected seven day period (the travel week). As travel behaviour varies considerably depending on the month of the year or day of the week, interviewing and travel record keeping were spread evenly over the year. Most analysis are carried out on three years data combined, making the total set sample size the same as that of each of the previous periodic surveys (15,120). A base of 15,120 provides the degree of precision required by DETR.

2.2 Sample design

2.2.1 The sampling frame

The NTS is based on a random sample of private households. The sampling process is carried out by the Sampling Implementation Unit (SIU) at ONS. The sample is selected using the 'small user' Postcode Address File (PAF), as a sampling frame. The PAF is constructed by the Post Office as a list of all addresses (delivery points) in the country. The 'small user' Postcode Address File is the file of delivery points which receive fewer than 25 items of mail each day. By using the small user file most large institutions and businesses are excluded from the sample.¹ However, some small businesses receive fewer than 25 items of mail a day and are included in the small user PAF so they may have been sampled. These were recorded as ineligible addresses by the interviewers, although interviewers were asked to call at the sampled address in order to check that no private household could be found at the address.

The version of the small user PAF used for selecting the sample is up-dated twice yearly and is specially adapted for use by ONS. The adaptation involves adding information from the Central Postcode Directory (CPD) held at ONS. Examples of the information added are Local Authority codes, wards, grid references and data from the census. A match is also made with the National Health Service Users Postcode

Directory (NHSUPD), also held at ONS, in order to add Health Authority codes. Addresses previously sampled for the NTS or for any other ONS social survey cannot be sampled for a period of three years.

2.2.2 Sampling procedures

In order to select the appropriate number of addresses, a stratified multi-stage random probability sample was used. There were two stages in the sample selection - the sampling of primary sampling units (PSUs) followed by the sampling of addresses within the selected PSUs. The PSUs were in the form of individual or groups of postcode sectors which contained an average of about 2,900 delivery points. Postal sectors south of the Caledonian Canal with less than 500 delivery points were grouped with contiguous sectors so that the minimum size of a group was 500 delivery points. The minimum size of a group of sectors north of the Caledonian Canal was 250.

Postal sectors covering Scottish Islands and the Isles of Scilly were excluded, as in other major Government surveys (see Table 2.1). The effect of this was to exclude 2.2% of the delivery points in Scotland, and about 0.2% of delivery points in the whole of Great Britain.

The sample is drawn biannually. 240 PSUs were selected in total in 1999, 20 per month; 21 addresses were drawn from each selected PSU.

A way of increasing the precision of a random sample is to stratify it. Before any selection takes place, the population is divided into a number of strata; then a random sample is selected independently within each strata. This ensures that different strata in the population e.g. regions, are correctly represented. This will also lead to a reduction in standard error.

The 1999 NTS sample was stratified using a regional variable and two PSU-level variables derived from the 1991 Census. The regional variable divides Great Britain into 18 regions defined by the nine Government Office Regions of England and Wales, with the former Metropolitan Counties and inner and outer London separately identified, together with the Central Clydeside Conurbation and the remainder of Scotland (Table 2.2).

Table 2.1 Areas omitted from the sample

Region	ONS code and Local Authority name	Name of areas excluded
Southwest	15UH Isles of Scilly	Isles of Scilly
Scotland	71UE Lochaber 78UH Cunninghame 71UH Skye/Lochalsh 78UP Argyll/Bute	Mallaig, Inverie, Soay, Eigg, Muck, Rhum, Canna. Arran, Great/Little Cumbrae. Whole authority. Bute, Oban/neighbouring islands, Gigha, Islay, Colonsay, Mull(pt).
Jura/	80UB Orkney 81UB Shetland 82UB Western Isles	Whole authority. Whole authority. Whole authority.

Table 2.2 The relationship of GOR6 to Government Office Regions (GOR)

16	South East Other	9	18
17	South West	10	20
18	Wales	11	12
19	Strathclyde	12	10
20	Scotland excluding Strathclyde	12	12

Excludes Scottish Islands. Includes mainland North of Caledonian Canal.

Within each of the 18 regions the PSUs were ranked in order of the proportions of households with no car and then split into three bands. Within each band the PSUs were ranked in alternate descending/ascending order by the proportion of heads of households in socio-economic groups 1 to 5 and 13 (that is a professional employer or manager). The PSUs were then sampled using a form of systematic sampling to produce a stratified sample.

The number of postcode sectors sampled was fixed in London, but elsewhere, it was proportional to the size (number of delivery points) of the region and was obtained by means of the following formula:-

$$\frac{\text{No. of delivery points in the region} \times 206}{\text{No. of delivery points in GB outside London}}$$

The aim was to give each household outside London an equal chance of selection. In London, the number of PSU selections was fixed at 15 in Inner London and 19 in Outer London. This ‘over-sampling’ in London was carried out in order to provide sufficient numbers for DETR’s particular analysis interest in the area, as response rates in London are lower than elsewhere.

In Great Britain as a whole around 24 million delivery points were available for possible selection with just under three million delivery points in the Greater London area. This means that nationally there was a one in 4,826 chance of an address being selected in the year; in Inner London a one in 3,697 chance of selection, and in Outer London a one in 4,485 chance.

If there is more than one household or business receiving mail at an address an adjustment will need to be made. The Post Office attaches an indicator (the Multi Occupancy Indicator or MOI) to show this. The MOI is intended to indicate the number of ‘letter boxes’ at the address. A shop with a flat above may have an MOI of two. In general, an MOI of three or more indicates a multi-household address. However, methodological work conducted within SSD has shown that this is only reliable in Scotland.² So in Scotland, addresses with an MOI of three or more were given a chance of selection equal to the MOI. In England and Wales the standard SSD multi-household procedures were used at addresses found to contain more than one household in order to ensure that all households were given an equal chance of selection.³ These procedures were carried out by interviewers at the fieldwork stage. All SSD interviewers are carefully trained in the use of these procedures the details of which are described in Section 2.3.

2.2.3 The allocation of PSUs to interviewer quotas

To reduce unnecessary travelling between addresses by the interviewers, all the addresses selected in a PSU were allocated as a single quota of work for an interviewer. In order to obtain a nationally representative sample for each quarter of the year the PSUs were allocated to quota months such that:

- a total of 20 selections were assigned to a month
- the correct number of PSU selections were made in each major stratum over the year
- the number of PSUs selected per major stratum was as equal as possible from month to month.

A listing of the PSUs allocated to each of the twelve quota months can be found in Appendix C.

2.3 Field sampling procedures

2.3.1 Multi-household procedures

Section 2.2.2. mentioned that the 1999 NTS used the standard SSD multiple-household procedure to ensure that all households at multi-household addresses had an equal chance of selection. These procedures were the:

- pre-sampled multi-household procedure
- concealed multi-household procedure.

These procedures are described in full in the NTS Interviewer Instructions. The key points are summarised below.

The pre-sampled multi-household procedure

The pre-sampled multi-household procedure was used at addresses in Scotland with a Multi Occupancy Indicator (MOI) of more than two. Interviewers were instructed to use a selection grid which will select 1 in n households (n being the value of the MOI). Occasionally a pre-sampled multi-household address contained fewer households than the value of the MOI. In such cases, no household would be selected; the selection grid would indicate to the interviewer that no interview was to be completed at the address and the interviewer would return the address as ‘directed not to sample any household at the address’.

The concealed multi-household procedure

The concealed multi-household procedure was used where interviewers came across multi-household addresses in England and Wales, and also at addresses in Scotland with an MOI of one. At these addresses interviewers were instructed to include all households up to a maximum of three. At addresses with more than three households interviewers used concealed multi-household selection grids to select three from the number present.

To limit the extent to which an interviewer’s quota could be inflated by the occurrence of several concealed and/or pre-sampled multi-households, interviewers were instructed to interview at no more than four extra households from concealed and/or pre-sampled multi-household addresses. This approach may have introduced a very slight bias against households in concealed multi-household addresses but the effect of this is likely to be negligible.³

2.3.2 Ineligible addresses

Three types of addresses were classified as ineligible for the NTS:

- Non-residential addresses and institutions (i.e. residential addresses that did not contain a private household). An institution was defined as: 'an address at which four or more unrelated people slept; while they may not have eaten communally, the establishment must have been run by a person (or persons) employed for this purpose, or by the owner'. Private households with separate accommodation within an institution were included in the survey.
- Residential accommodation not used by a household as their main address (e.g. a holiday home or second home). This group was excluded to avoid double counting - households occupying these accommodation had already had a chance of selection at their

permanent address.

- Addresses in the PAF that did not exist because they had been demolished, not yet been built, or perhaps two converted flats had been recombined into one house.

2.4 Calculation of sampling errors

The NTS analysis system contains two variables used for the calculation of sampling errors. The five digit area number can be used to arrange the PSU selections in the correct order, the first two digits giving the major stratum and the second three the PSU selection. Then to obtain sampling errors one applies the formula of successive differences within major strata as described in A Sampling Errors Manual by Bob Butcher and Dave Elliot (OPCS 1987), section 3.3, in particular part 3.3.2(ii).

Some examples of sampling errors were calculated for 1995/97 variables and are given in the 1997 NTS Technical report.⁴

Table 2.3 Description of the P-level variables

Variable	Description
P1	The Area Number - identification number for the PSU laid down in the sample design.
P2	Describes the category of planning region (Scotland, Wales and the eight Standard Statistical Regions of England).
P3 - P4	Left blank for the use by DETR.
P5	Type of area - P5 was constructed from a classification of urban areas derived by ONS and DETR from the 1991 Census of Population.
P6	PSU population density derived from population density figures supplied by ONS.
P7	Local authority population density derived from population density figures supplied by ONS.
P8-P14	This information was obtained by DETR from a questionnaire sent to all local authorities in Great Britain in 1995/96. ¹
P8	Availability of concessionary bus fares schemes for pensioners.
P9	Eligibility for concessionary bus fares schemes for pensioners.
P10	Type of concessionary bus fares schemes for pensioners.
P11	Membership fee for concessionary bus fares schemes for pensioners.
P12	Times available for concessionary bus fares schemes for pensioners.
P13	Geographical area covered by the concessionary bus fares schemes for pensioners.
P14	Additional modes of public transport covered by the concessionary fares scheme for pensioners.

¹ 'Concessionary fare schemes in Great Britain in 1995/96', DETR (1997).

2.5 PSU level variables

Fourteen of the survey variables were measured at PSU level (P level). A value on a P-level variable applies to all households living within that PSU. The P-level is therefore the highest level at which the data of the continuous survey may be analysed, coming just above the H (Household) level in the analysis hierarchy. Unlike almost all other variables in the survey, the PSU variables were not derived from information provided by members of the sampled households. Details on the derivation of the variables are given in Table 2.3. A detailed description of the PSU-level variables is given in the 1997 NTS Technical Report⁴.

Notes

1. The characteristics of the PAF as a sampling frame are described in the paper 'An evaluation of the PAF as a sampling frame and its use within OPCS' Wilson P and Elliot D, *The Journal of the Royal Statistics Society Series A* (1987).
2. 'Multi-household procedures for social survey', Barton J, *Survey Methodology Bulletin No. 40* (1997) ONS.
3. 'Office and field procedures for dealing with multi-household addresses', Dodd T, *Survey Methodology Bulletin No. 5* (1979) ONS.

Chapter 3 Field Work procedures and response

3.1 Introduction

The 1999 NTS was a continuous survey with interviewing occurring every month of the year. In addition to the interview, all respondents were asked to keep a record of their travel over seven consecutive days. The travel recording period for each month (the quota month) ran from mid-month to mid-month (Table 3.1). Field work for each quota month of the survey started at the beginning of the month when interviewers contacted households to complete the interview and “place” the travel records and was completed at the end of the following month when all the travel records had been collected and transferred by the interviewer to the computerised Journey Input System.

Since October 1994 the NTS interview has been conducted using Computer Assisted Personal Interviewing (CAPI). Blaise 3, a software system developed by Statistics Netherlands was used to write the 1999 questionnaire. On NTS, the household, individual and vehicle sections as well as the administration details were incorporated into a single Blaise data model. The Journey Input System was written in the database language ‘Clipper’ which was also used for data handling purposes by SSD. Both systems cross-referenced one another.¹

3.2 Questionnaire discs and despatch of documents to interviewers

Each month the sampled address lists and paper documents, such as the travel records, were despatched to the relevant interviewers from ONS. Computerised details of the addresses to be interviewed were created and then transmitted to the interviewers via a system of direct communication using modems and dedicated telephone lines. Floppy discs containing the CAPI questionnaire were compiled and posted from ONS.

Technical queries from interviewers regarding the transmission of data were dealt with by a special unit set up to deal with such matters. Laptop maintenance was handled by a separate support unit.

3.3 Public Relations

It was important that informants had complete confidence in the survey and in the interviewer. In advance of the interviewer’s call, SSD wrote to each sampled address to inform them of the visit and interview content. For sampled addresses in London, a special ‘London leaflet’ designed to explain the importance of the survey to informants living in that area was also included with the advance letter.² The “London

Table 3.1 1999 quota month end dates

December	12	December	10	January

* The survey year ran from mid-January 1999 to mid-January 2000.

leaflet” was introduced to encourage more people to take part in the survey in an area where it was relatively more difficult to achieve a high response.

As with all other ONS surveys, the advance letter informed households at the selected addresses that the survey was not compulsory and relied on voluntary co-operation. Informants were also told that any information they gave would be treated in the strictest confidence.

Interviewers were notified of any refusal made to ONS headquarters as a result of the advance letter. These “headquarters refusals” were included in the overall refusal rate but did not count against the interviewer on the individual interviewer response scores.

Before going into the field all ONS interviewers were issued with a photo identification card. Informants had the opportunity to call ONS headquarters to establish the validity of any interviewer.

3.4 Administering the placement pattern

In response to requests from field managers and interviewers the 1999 NTS used two different new placement patterns for the allocation of travel weeks to sampled addresses. The original placement pattern was thought to be too rigid and therefore a new, more flexible, procedure was introduced. The following two sections outline the two different patterns used in 1999.

3.4.1 Placement pattern up to May 1999

The day on which a sampled household was to start the seven-day travel record keeping (the travel week) was fixed in advance. This ensured an even spread of travel weeks throughout the month which therefore reduced any bias caused by fluctuations in travel behaviour throughout the month. Since October 1995 the assignment of addresses to travel weeks was controlled by the Computerised Allocation System (CAS) which, according to set rules (see below), automatically allocated the 21 addresses in an interviewer’s quota to individual dates throughout the quota month.

However, under the following circumstances the travel week could be altered and reallocated:

- when no contact with the address had yet been made;
- where there had been contact with the house-

hold but one or more individuals were not available for interview before commencement of the original travel week;

- where the household was reluctant to co-operate at the initial contact and perseverance at that point may have precipitated a refusal.

To avoid introducing bias into the reallocation of addresses, interviewers were instructed to view reallocations as exceptional cases and reallocations were not allowed once the interviewer had mentioned the travel week. This was to avoid informants choosing an easy or interesting travel week. The rules governing postponement are described below.

The CAS automatically allocated sampled addresses to pre-specified travel weeks according to the rules of the survey. Initially, each of the 21 addresses in a quota was allocated a different seven-day travel week. The travel week for an address was determined by i) the day of the week (start day) and ii) the week of the month (allocation period).

Each address had a fixed and unchangeable start day according to its address number. For example:

<u>Address Number</u>	<u>Start day</u>
01,08,15	Sunday
02,09,16	Monday
03,10,17	Tuesday
04,11,18	Wednesday
05,12,19	Thursday
06,13,20	Friday
07,14,21	Saturday

Every quota month consisted of either 30 or 31 days and was divided into four allocation periods (1-4), each consisting of seven or eight days. Five addresses were assigned to three of the allocation periods and six addresses to one of the periods. The period consisting of six addresses rotated between periods 1,2 or 3 according to one of three allocation patterns (A, B or C) selected at random for that quota month.

The system also assisted interviewers with amending the allocation, where necessary, in order to help maintain response whilst still adhering to the rules of the survey, which were:-

- there were always at least five and no more than six addresses in each allocation period;
- no two addresses had the same start date.

3.4.2 Placement pattern from May 1999

The new placement pattern used on a trial basis from May onwards was based on a 'first come, first served' approach. The principle for assigning Travel Weeks was for interviewers to allocate the first address contacted from their quota list to the first date available on their allocation card, the second address to the second date and so on. In other words, as an interviewer progressed through their quota, the number of travel weeks available became less. If an address was ineligible, or the household refused to take part in the survey, their allocated date was not used.

Travel Weeks were spread across four periods, three of which were allocated 5 addresses and one 6 addresses. In exceptional circumstances, such as not being able to contact a household or a household being away but willing to participate, interviewers used a 5th allocation period. This being the first allocation period of the following month. Each address was assigned one date for the start of the travel week which was selected at random by the computer. Originally the addresses were randomly ordered, and the interviewer had to visit the addresses in strict rotation. From the September quota onwards this was dropped in favour of a system whereby the interviewer visited the addresses in the order most convenient for them, to reduce unnecessary travelling. It was not thought that this would increase bias since the respondents were still unable to choose the dates themselves. Further analysis appeared to support this assumption.

3.5 The interview

The NTS interview at each household could be divided into a strict sequence of events:-

- the placement call
- the reminder call
- the mid-week checking call
- the pick-up call

The initial interview was carried out at what was termed the 'placement call'. At this call the interviewer explained the purpose of the survey, ideally to the entire household, and gained the co-operation of the entire household. The interviewer then asked the head of household or partner questions about the household composition, the household's vehicles and some general background information. Questions were then asked of each individual in the household including children and babies (although for children under the age of 11 the interviewer generally talked to the parent as well as the child). Questions were also asked about each household vehicle from the person

best able to give that information (usually the main driver). The interviewer introduced and placed the seven-day Travel Record, and where appropriate, a chart to enter fuel and mileage details for each vehicle in the household and for long distance travel. Interviewers took time to explain in detail how to record journeys made during the travel week and talked the informants through some examples, explaining what to include and what not to include and described the survey definitions, for example, usual place of work, in course of work etc.³ From October 1996, pocket size diaries were occasionally handed out to help informants record details of their journeys. In addition, an NTS pen was left for each household vehicle to aid the completion of the fuel and mileage chart and an NTS fridge magnet was left with each household (for public relations purposes).

When there was a gap of more than a day or two between the placing call and the start of the travel week, the interviewer made a reminder call, either by telephone, post or in person to the household. Interviewers were encouraged to make the call in person where they were concerned about a particular household's commitment to diary keeping.

Sometimes the interviewer would make an additional mid-week checking call on a household part way through the travel week to help with problems and encourage accurate record keeping. This call was made at the interviewer's discretion when she/he judged that informants needed encouragement or assistance with record keeping. Again, interviewers were encouraged to call in person.

Pick-up calls were made within six days of the end of record keeping. Interviewers were instructed to target households where they were uncertain of the informant's ability to maintain accurate records and make those pick-up calls within one or two days of the end of record keeping. The interviewer collected the travel record of each household member and checked the contents with the informant. The interviewer also asked some additional questions about any vehicles acquired since the placement interview, whether a provisional or full driving licence or season ticket had been acquired and also about any long distance journeys made between placement and the start of the travel week. These questions were also asked using a Blaise CAPI questionnaire. Fuel and mileage charts were also collected and information about vehicle mileage and fuel gauge details were entered into the CAPI questionnaire either during the pick-up interview or later, by the interviewer at home.

3.6 The 1999 NTS questionnaire

3.6.1 Questionnaire structure

The structure of the 1999 questionnaire is set out in Figure 3.1. A maximum of 10 people, 10 vehicles and 40 long distance journeys per person could be included in any one household interview. When an interviewer encountered a household larger than this a second household would have been opened and the data stored separately to be merged after structure checking, back at the office.

The NTS continuous dataset is usually analysed in three year periods (1989/91, 1992/94, 1995/97), so it has been convenient to introduce new variables at the start of each new three year period, in 1992, 1995, and 1998. Consequently there were few changes to the questionnaire in 1999.

The text of the 1999 questionnaire is set out in Appendix A. The key differences between the 1999 and 1998 questionnaires are set out below.

Individual level questions:

- New recall question (asking if ONS may contact respondent again if necessary) changed in line with harmonisation (*Recall2*)
- Adoption of the “harmonised” question on marital status (*MarStat*) to improve comparability of NTS data with data of other government sponsored social surveys.

Unitary Authorities

In April 1998 the final Unitary Authorities (UA) were introduced in England. The National Travel Survey now codes Unitary Authorities as well as counties in

Figure 3.1 The structure of the questionnaire

Section	Subject

Employment, Occupation and Industry details, Income. Place of work and travel to work. Season ticket details. Any long distance journeys made. Long distance journey information. Recall question.
Vehicle	Introduction. Registration details. Parking. Vehicle subsidies. Mileage. Pick-up questions from fuel and mileage chart.
Admin. block	Calls and contact information. Occupation, Industry and Outcome coding. Reasons for refusal.
Journey input and editing system	Journey data input and error checking program.

England, Scotland and Wales on three different parts of the questionnaire: origin and destination codes for long distance journeys; place of work; and origin and destination on the diary journeys. Coding of county and UA for these questions is done using a frame consisting of approximately 1600 place names, together with the county and UA. Places not contained within a new UA were coded with the county only for both fields.

NTS and are detailed in figure 3.2.

3.7 Post interview coding and checking

After collecting the information and material from households at the pick up call, interviewers transferred the data from the travel records into the computerised Journey Input System, coded the occupation, industry and socio-economic group of each informant aged 16

3.6.2 Harmonised Questions

Harmonised questions were introduced to the NTS to allow users to compare NTS data with those from the other government social surveys⁴. These replaced similar questions previously used in the NTS. A number of harmonised questions are used in the 1999

and over and the interview outcome for each household.

3.7.1 Transferring the data from the travel records

At the interviewer's home the data from the travel records were transferred to the Journey Input System

written in the database language Clipper. This was basically a straightforward data entry operation where the information was simply copied across onto the interviewer's laptop computer. The system was designed to match the travel records layout exactly. Any inconsistencies identified at this stage were corrected by the interviewer, if necessary checking with the informant. The interviewer then ran the journey checking program comprising pre-specified consistency and plausibility checks and made appropriate amendments, again checking back with informants where necessary or referring to coding instructions.

3.7.2 Timelines

At any stage during the journey input and checking process interviewers could access the NTS 'Timelines' to obtain a graphical display of journey data. Timelines was developed jointly by SSD and the University of Westminster Transport Studies Group for SSD applications such as the NTS. The program displayed each day of travel for each household member in the form of a continuous time line running from left to right across the laptop screen. Each journey was numbered and start, duration, and end times were shown. The journey purpose code was displayed so interviewers could see how long an individual spent on a particular activity (Figure 3.3).

Figure 3.3 Timeline

Timelines enabled interviewers to obtain a complete picture of a household's travel patterns on one screen. It showed each individual in the household for the whole of the travel week or all household members on any one day of the travel week. Timelines could also be used to display journeys for individuals who travelled together on a particular day. At a glance, interviewers were able to see the household's journey structure and identify errors or gaps in the data, including some which it may not have been possible to identify in the journey checking program. For example, a person may have left home for work at the same time every day but on one day left later than usual. The checking program did not identify this as an error or a plausibility query because such checks

would have generated an enormous number of error messages. However, such possible inconsistencies were easily visible in Timelines. It therefore provided a useful tool for assuring and improving data quality.

Timelines could also be used as an editing tool back in the office. Editors could immediately obtain a visual picture of a household's complex travel movements across the whole of the travel week before they begin editing.

3.7.3 Socio-economic group and industry coding

The occupation of informants aged 16 or over and who had ever worked were coded using the Standard Occupational Classification (SOC) (1990). Industry information was coded using the Standard Industry Codes (SIC) (1992). Details of the classifications are set out in Table 3.2.

The NTS used the standard SSD closed census matrix which derives Socio-economic Groups (SEG) and Social Class from the standard occupation (SOC) and employment status codes. Where the combination of SOC and employment status was invalid, eg. self-employed policeman, the matrix would impute the 'most likely' SEG and social class according to standard priority rules. A signal in the Blaise instru-

ment indicated when the combination was invalid. If the signal was suppressed by the interviewer, SEG and social class would be automatically imputed.

3.7.4 Coding the outcome for each household

Households eligible for interview were divided into 3 categories for outcome coding purposes: fully co-operating households, partially co-operating households and non-responding households.

A household was coded as 'fully co-operating' if there was complete journey information for each individual in the household and the bulk of the rest of the information was present. The majority of all of the follow-

ing sections should have been completed:

- the household section
- an individual section for each person listed in the household box
- a vehicle section for each vehicle listed in the vehicle grid
- all journeys for each person entered into the journey input system and checked fully.

A ‘partially co-operating’ household must have had at least a household questionnaire completed. A household would be included as ‘partially co-operating’ if any journeys were missing.

An eligible household was said to be ‘non-responding’ if the household had refused to take part in the survey or the household was away for the whole of the interviewing period and the interviewer was unable to make contact.

Interviewers also had to assign an outcome code (Table 3.3) to the households they had classified as ineligible using the criteria set out in Section 2.3.2. The code the interviewer would assign to an ineligible household was dependent on the reason for its ineligibility.

Table 3.3 List of outcome codes

OUTCOME	Outcome codes
FULLY CO-OPERATING - all diaries present	11
PARTIALLY CO-OPERATING -:	20
- non contact with one or more elements	21
- refusal by one or more elements	22
- incomplete travel diary for one or more persons	23
REFUSAL	
- refusal to HQ letter	31
- refusal at introduction/before interview	32
- refusal during interview	33
- no interview - contact incapable / language problems	34
NON-CONTACT	
- no contact with any household member	41
- household away all field period	42
INELIGIBLE

- not yet built/under construction	52
- demolished/derelict	53
- vacant/empty/being refurbished	54
- non-residential/business only	55
- institution	56
- temporary accommodation/second home	57
- household contains only foreign diplomats or foreign servicemen living on base	58
- directed not to sample any household at the address	59
- household limit on quota (4) already achieved	60

3.7.5 Interviewer query service

In the past one person would have closely supervised the office editing process thereby minimising coding and editing bias. Under CAPI interviewers carried out the editing procedure. In order to reduce variability and possible bias among interviewers a service was

provided whereby interviewers could report queries relating to survey definitions or coding. The queries were handled by the NTS field co-ordinator who could obtain an overview of all interviewers' work. Any queries not covered by the instructions were referred to the research officer and displayed on the NTS electronic bulletin board. If necessary, the

Chapter 4 Data Processing

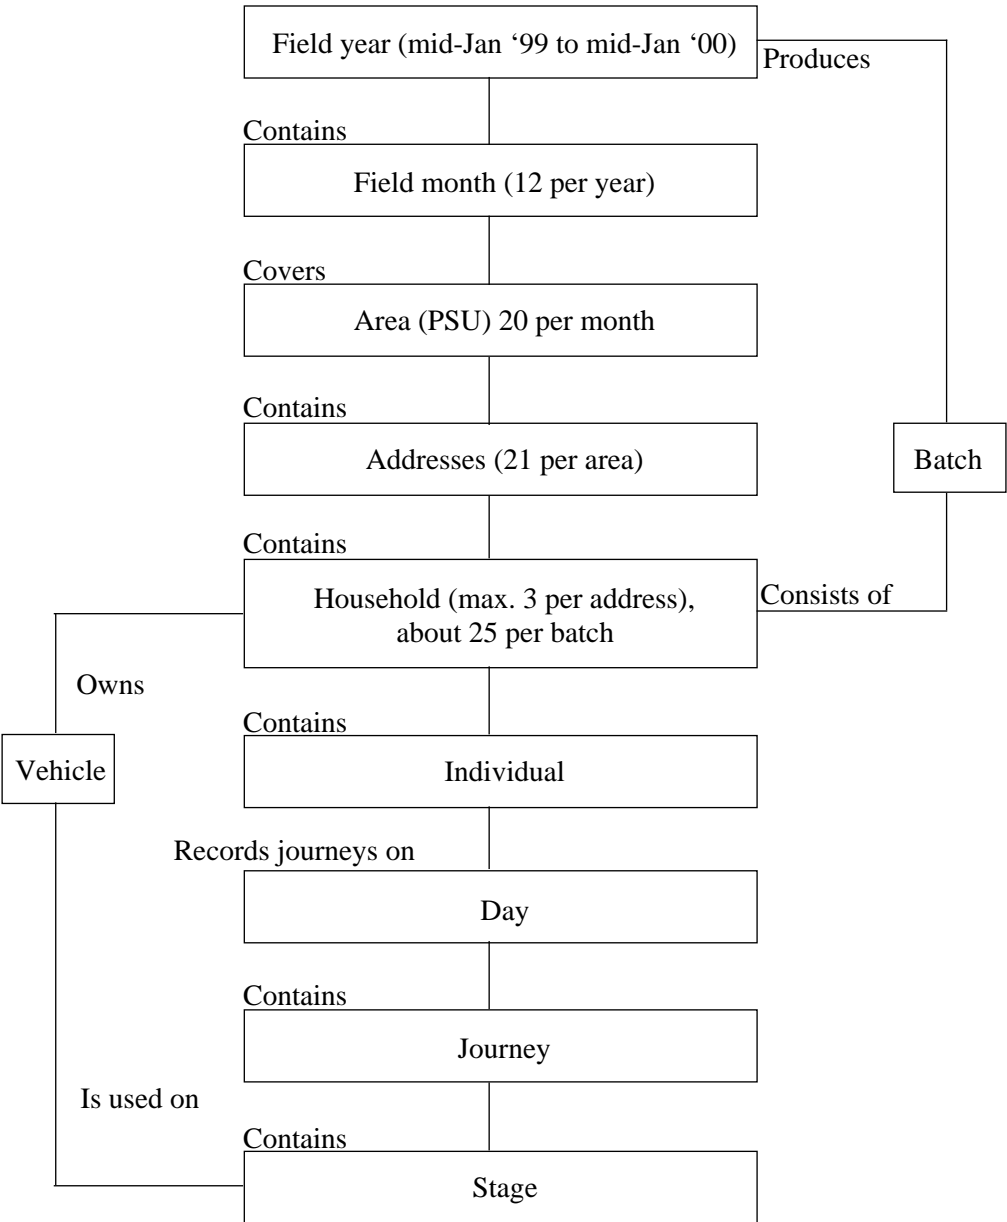

4.1 Data transmission and despatch of paper documents from interviewers

On a weekly basis interviewers transmitted data to ONS. To ensure security, the data were encoded before transmission. Any paper documents were posted to ONS at the end of the field period. The final transmission and posting date was the 28th of the month in which field work was completed.

4.2 Downloading and structure checking

In order to download data transmitted by interviewers into a single dataset, a program was run which unzipped, aggregated and added interview data together. A procedure for checking the data was then implemented. This procedure checked for blank, deleted and duplicated records and reported errors. It also carried out structure checking of the data to make sure that journey information had been coded in accordance with the household outcome coding. Data structure details are set out in Figure 4.1.

Figure 4.1 Data structure

4.3 Data editing

Following the move to CAPI, almost all of the old paper editing system was incorporated into the CAPI program and carried out by interviewers. Some follow-up work was, however, conducted after ONS had received the transmitted data using a separate Blaise program. A brief description of the in-house coding and editing procedure is given below. Further details of the checks and coding carried out by the editing staff are given in the NTS headquarters editing instructions.

4.3.1 Interviewer's notes and suppressed checks

At any time during the interview interviewers were able to open a note using the Blaise note book facility. All interviewer notes created in this way were printed on the NTS fact sheet accompanying each household. Most notes contained an explanation of why an interviewer had suppressed a particular error message and may not have required any action from the HQ editor. However, sometimes interviewers may have been unsure about how to code a question, for example, the type of season ticket or area travel card used, and would record the name of the ticket and further details in the Blaise notebook. The editors were then able to check the interviewer's coding or recode if necessary.

4.3.2 Coding

i) Re-coding

Wherever the interviewer had recorded an 'other specify' answer the editor would be required to either re-code to one of the pre-specified answers or leave in the 'other specify' category. A decision would be made based on information recorded by the interviewer in the Blaise note book or in a separate text variable.

ii) Make and model coding

Where a particular vehicle make and model was 'not listed' in the make and model coding frame editors were required to allocate a code back in the office.

iii) Fuel tank size coding

The fuel tank size for most vehicles was automatically coded using the vehicle's make and model information. Editors were only required to enter the exact size of the vehicle's fuel tank for vehicles not listed in the make and model coding frame or if the informant had been unable to provide the information.

iv) County and unitary authority coding

Where interviewers had been unable to allocate a county code and unitary authority, for usual place of work or journey origin and destination, editors were required to allocate the correct code.

4.4 Data conversion

The data was organised into seven record types according to the requirements of DETR (Table 4.1): households, individuals, vehicles, whether made long distance journeys, long distance journeys details, journeys and stages. Missing values were interpreted as 'no answers' (-8) and 'does not apply' (-9). Final checks were made by ONS research staff at the aggregate level using SPSS to ensure the accuracy of the data. The files were then converted to ASCII format and sent to DETR by e-mail.

Table 4.1 Record types

Record type	Data	Level
Record 1	Households	Household
Record 2	Individuals	Individual
Record 3	Vehicles	Vehicle
Record 4	Whether made long distance journeys	Individual
Record 5	Long distance journeys (LDJ) made before the Travel Week	LDJ
Record 6	Journeys made during the Travel Week	Journey
Record 7	Stages of journeys made during the Travel Week	Stage

MarStat** Are you/is name married, living
together as a couple, single, widowed,
divorced or separated?

- (1) Single/never married
- (2) married
- (3) Separated
- (4) Divorced
- (5) Widowed

ASK IF: AGE >=16

AND: MarStat <> MarrLiv

LiveWith** May I just check, are you living with
someone in the household as a
couple?

(1) Yes
(2) No
(3) SPONTANEOUS ONLY - Same
sex couple

ASK ALWAYS:

RelHoh** INTERVIEWER: Code relationship
to HOH

- (1) Head of household
- (2) Spouse/partner/cohabitee
- (3) Child of HoH or spouse
- (4) Parent of HoH or spouse
- (5) Other relative
- (6) Other non-relative

QResLen

ASK ALWAYS:

HLong** RECORDED for HoH (^LDMInt
Name) ONLY

How long have you (has ^LDMInt
Name) lived at this address? ...
(HELP<F9>)

- (1) Less than 12 months
- (2) 12 months but less than 2 years
- (3) 2 years but less than 3 years
- (4) 3 years but less than 5 years
- (5) 5 years but less than 10 years
- (6) 10 years but less than 20 years
- (7) 20 years or more

ASK IF: HLong = less than 12 months

HMnths How many months have you (has
^LDMIntName) lived here?

1..12

ASK IF: HLong = less than 12 months

OldAdd Is your (is ^LDMIntName)'s old address more than one mile from here or less than that?

- (1) More than one mile
- (2) One mile or less

QTenure

ASK ALWAYS:

Ten1** In which of these ways do you occupy this accommodation?
SHOW PROMPT CARD AA MAKE SURE ANSWER APPLIES TO HoH (^DMNAMES[LDMHoHnum])
(HELP<F9>)

- (1) Own outright
- (2) Buying it with the help of a mortgage or loan
- (3) Pay part rent and part mortgage (shared ownership)
- (4) Rent it
- (5) Live here rent-free (including rent-free in relative's/friend's property; excluding squatting)
- (6) Squatting

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Tied** Does the accommodation go with the job of anyone in the household?

- (1) Yes
- (2) No

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

LLord** Who is your landlord?... (HELP<F9>)
CODE FIRST THAT APPLIES

- (1) the local authority/council/New Town Development/ Scottish Homes
- (2) a housing association or co-operative or charitable trust
- (3) employer (organisation) of a household member
- (4) another organisation
- (5) relative/friend (before you lived here) of a household member
- (6) employer (individual) of a household member
- (7) another individual private landlord?

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Furn** Is the accommodation provided: ...
(HELP<F9>)

- (1) furnished
- (2) partly furnished (eg carpets and curtains only)
- (3) or unfurnished?

QLocServ

ASK ALWAYS:

SatServ [*]
Now I would like to ask some questions about your local bus services. By local I mean services which operate near your home. How satisfied are you with your local bus services?

SHOW PROMPT CARD A

- (1) Very satisfied
- (2) Fairly satisfied
- (3) Neither satisfied nor dissatisfied
- (4) A little dissatisfied
- (5) Very dissatisfied
- (6) Don't use buses

ASK ALWAYS:

EncRage Would you be encouraged to use local buses more often if improvements were made to the bus services?

- (1) Yes
- (2) No
- (3) Not sure

ASK IF: ((EncRage = Yes) OR (EncRage = NtSure))
OR (EncRage = DONTKNOW)

Improv

Which do you think are the main ways in which the services could be improved? Please use this card as a guide and mention up to four.

INTERVIEWER: SHOW PROMPT CARD B.....SEPARATE CODES WITH . OR -

USE <F6> AND PAGE DOWN KEY TO SEE MORE CODES SET [4] OF

- (1) Better provision for the disabled/elderly
- (2) Better provision for people with young children or heavy shopping
- (3) Cheaper fares
- (4) Boarding point closer to home
- (5) Quicker journey time
- (6) More destinations or routes
- (7) More reliable or punctual services
- (8) More frequent services at weekends
- (9) More frequent evening services
- (10) More frequent day-time services
- (11) Better information about services
- (12) Other (SPECIFY IN A NOTE)

ASK ALWAYS:

BusProv

Which is the main type of bus provided locally. Is it...

RUNNING PROMPT

- (1) mainly small buses (mini-buses or midi-buses)
- (2) mainly large buses
- (3) OR an equal mixture of both small and large buses?
- (4) No local bus service

ASK ALWAYS:

NearBus

About how long would it take ME to walk from here to the NEAREST bus stop (or place where I could get on a bus)? (I am interested in the NEAREST one even if it isn't the main one you use.)

INTERVIEWER: IF INFORMANT GIVES A RANGE eg. 25-30 MINS THEN CODE LOWEST GROUP ie. 4

- (1) 3 minutes or less
- (2) 4-6 minutes or less
- (3) 7-13 minutes
- (4) 14-26 minutes
- (5) 27-43 minutes
- (6) 44 minutes or longer

ASK ALWAYS:

GetBus

How often would I be able to get a bus from that bus stop during the day?

PROMPT AS NECESSARY IF VARIES' TAKE WEEK DAY OFF-PEAK FREQUENCY

- (1) Less than once a day
- (2) At least once a day
- (3) At least once an hour
- (4) At least once every half-hour
- (5) At least once every quarter-hour

ASK ALWAYS:

NearSta

Now thinking of your local train service, how long would it take ME to walk to your nearest railway (that is, ex-BR) or underground station? Again it is the NEAREST one I am interested in, even if it is not the main one or the one you use.

- (1) 6 minutes or less
- (2) 7-13 minutes
- (3) 14-26 minutes
- (4) 27-43 minutes
- (5) 44 minutes or longer

ASK IF: ((NearSta IN [min13 .. min44]) OR (NearSta = DONTKNOW)) OR (NearSta = REFUSAL)

BusSta

Can I just check....
How long would it take ME to get to the station by bus?
Include walking to and from the bus stop but assume there is no waiting time.

- (1) No bus service/quicker to walk
- (2) 6 minutes or less
- (3) 7-13 minutes
- (4) 14-26 minutes
- (5) 27-43 minutes
- (6) 44 minutes or longer

ASK ALWAYS:

DescTa

Would you tell me which description is most like your nearest railway (or underground) station? Is it a...

RUNNING PROMPT:

- (1) station with frequent services throughout the day (at least once per hour)
- (2) station with frequent services only during rush hours (at least once per hour)
- (3) or a station with less frequent services?

QAmenity

ASK ALWAYS:

IntroA I would now like to ask you some questions about how long it would take to WALK from here to each of the following places.

PRESS 1 TO CONTINUE

1..1

Park

ASK IF: Intro = Now

WherePk RUNNING PROMPT
Can you tell me where the ... is
usually parked overnight?
Is it usually parked overnight...

- (1) in the garage (at this address),
- (2) not garaged but still on the
property of this address,
- (3) on the street/public highway,
- (4) or elsewhere (at or near your
home)? (SPECIFY IN A NOTE)
- (5) DOES NOT USUALLY PARK
AT/NEAR HOME

ASK IF: WherePk IN [Street, Other]

HowFar RUNNING PROMPT
Approximately how far from the
boundary of your property is the
vehicle usually parked overnight?
INTERVIEWER: BOUNDARY OF
PROPERTY MEANS NEAREST
ACCESS POINT TO ROAD
e.g. GATE OR DOOR IF NO
GARDEN
FOR THE PURPOSE OF THIS
QUESTION 1 METRE IS THE
SAME AS 1 YARD
NOTE THE LENGTH OF A FORD
ESCORT IS APPROXIMATELY 5
YARDS

- (1) right outside,
- (2) not right outside but less than 10
yards/metres away,
- (3) 10 yards but less than 100 yards/
metres away,
- (4) 100 yards/metres away or more?

ASK IF: HowFar = Less100

HowFar2 How many yards/metres away from the boundary of your property is the vehicle usually parked?

BOUNDARY OF PROPERTY
MEANS NEAREST ACCESS
POINT TO ROAD
E.G. GATE OR DOOR IF NO
GARDEN
A FORD ESCORT IS ABOUT 5
YARDS LONG

10..99

ASK IF: HowFar = More100

HowFrMin How long does it take you to walk from the boundary of your property to the place where the vehicle is usually parked?

GIVE THE ANSWER TO THE

Could you tell me in which of these bands on this card is the approximate total MILES this vehicle is driven in a year?

INTERVIEWER: IF DK
ENCOURAGE ESTIMATE.
OBTAIN EXPECTED MILEAGE IF
VEHICLE ACQUIRED LESS THAN
A YEAR AGO.

- (1) 0 - 499 miles
- (2) 500 - 999 miles
- (3) 1,000 - 1,999 miles
- (4) 2,000 - 2,999 miles
- (5) 3,000 - 3,999 miles
- (6) 4,000 - 4,999 miles
- (7) 5,000 - 6,999 miles
- (8) 7,000 - 8,999 miles
- (9) 9,000 - 11,999 miles
- (10) 12,000 - 14,999 miles
- (11) 15,000 - 17,999 miles
- (12) 18,000 - 20,999 miles
- (13) 21,000 - 29,999 miles
- (14) 30,000 miles and over

ASK IF: (AnMiles > 0)

KmOrMile INTERVIEWER ASK OR CODE:
WAS THE ANSWER TO
ANMILES' IN MILES OR
KILOMETRES?

- (1) Miles
- (2) Kilometres

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles)
OR (((DMVEHTYPE= Wheel4 OR Lightvan)) AND
((AnMiles <> RESPONSE) OR (KmOrMile <>
RESPONSE))))

UsualWk Can you please estimate how many of the total annual miles, if any, are driven by anyone in the household in getting to or from a usual place of work, either all of the way or part of the way?
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles)
OR (DMVEHTYPE = Wheel4 OR Lightvan) AND
((AnMiles <> RESPONSE) OR (KmOrMile <>
RESPONSE))

CoursWk Leaving aside these journeys, can you estimate how many of the total annual miles, if any, are driven by anyone in the household in the course of work?
IF NIL ENTER 0

0..99999

ASK IF: (CoursWk > 0)

GoodsWk And can you estimate how many of these ^CoursWk miles are driven by anyone in the household whilst carrying goods in the course of work
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND ((KmOrMile = Miles) OR (((DMVEHTYPE = Wheel4 OR Lightvan)) AND ((AnMiles <> RESPONSE) OR (KmOrMile <> RESPONSE))))
AND: (((AnMiles = RESPONSE) AND (UsualWk = RESPONSE)) AND (CoursWk = RESPONSE)) AND (AnMiles >= (UsualWk + CoursWk))

Othmile So that means that the vehicle is driven about ^OtherM miles a year for all other journey's.
ENTER THE NUMBER SHOWN IF CORRECT

0..99999

ASK IF: FuelTyp <> Electric) AND (BorHire <> LessYear))
AND: (IchEmp = Yes) AND (KmOrMile = Km)

UsualKm Can you please estimate how many of the total annual kilometres, if any, are driven by anyone in the household in getting to or from a usual place of work, either all of the way or part of the way?
IF NIL ENTER 0

0..99999

ASK IF (KmOrMile = Km)

CoursKm Leaving aside these journeys, can you estimate how many of the total annual kilometres, if any, are driven by anyone in the household in the course of work?
IF NIL ENTER 0

0..99999

ASK IF: (CoursKm > 0)

GoodsKM ^DMVEH[LTLoooper]

And can you estimate how many of these ^Courskm kilometres are driven by anyone in the household whilst carrying goods
IF NIL ENTER 0

0..99999

ASK IF: (IchEmp = Yes) AND (KmOrMile = Km)
AND: (((AnMiles = RESPONSE) AND (UsualKm = RESPONSE)) AND (CoursKm = RESPONSE)) AND (AnMiles >= (UsualKm + CoursKm))

Othkm So that means that the vehicle is driven about ^otherkm kilometres a year for all other journeys.
ENTER THE NUMBER SHOWN IF CORRECT

0..99999

National Travel Survey

In confidence

Travel record of

Travel week

Start day

Finish day

Include *walks* on the first six days if they are a mile or more

Include *all walks* on the final day

Enter *every journey* you do on any other method of transport (bus, train, car, bicycle etc.)

The interviewer

will call again on

Day

Date

Time

Purpose of journey (A)

We are interested in a simple description such as *'to work'*, *'to get home'*, *'from work to food shopping'*, *'take a child to school'* etc. If you are unsure, make a note and the interviewer will sort it out.

Time left and time arrived (B and C)

Write in hours and minutes. For example 9:15

From and to (D and E)

Write down the name of the place where your journey started and finished. We are interested in the actual name of the village or town. (You need only record 'H' or 'W' if the journey started or finished at Home 'H' or Work 'W'.)

Method of travel (F)

Show each different method on a separate line, eg *car*, *train*, *bus*. On the first 6 days include walk as a method if it is a mile or more (20 minutes or more). On the final day include **every** walk you do.

Distance (G)

Write in miles and part miles. For example 1.5

Number in party (H)

This means the number of people who set out together. To be included in your party a person must be with you for at least half the distance.

How to fill in your travel record

Time travelling (I)

Give time spent **travelling** on a bus/train, in a car or walking. Please do NOT include time spent waiting for buses/trains.

Cost (J)

Write the amount paid for the actual journey - so for a journey made with a **season ticket** write *nil*. A journey made with a **pass** may be free or you pay something. If so, write down the cost.

Driver/passenger (K)

For journeys by car or motorbike please record whether you were:

the driver	DR
front passenger	FP
or rear passenger	RP

Drivers only: where parked and cost (L)

We would like to know here if the car/motorbike was parked:

- 'on the street'
- 'on own/friend's property'
- 'in a park-and-ride car park'
- 'in another public car park'
- 'in firm's car park'
- 'in a private car park'
- or 'not parked.'

Please write whether the parking cost was Free (**F**) / Permit (**P**) / Season ticket (**S**) **OR** write the cost of parking in '£ : p' if it was a one-off payment

Notes (M)

Use this column to note down anything you want to tell the interviewer. For example if you have used a bus pass, season ticket etc.

To help you in recording, here are examples of fuel gauges in two popular models of cars:

Please record the actual level shown. Since some gauges stick on 'full', if your gauge shows 'full' you will be asked if you think the vehicle had done at least 20 miles since fuel was last put in the tank.

And since some gauges show 'empty' when there is still quite a lot of fuel in the tank, if your gauge shows 'empty' you will be asked if you think the vehicle could have done at least another 20 miles before the tank ran dry.

THE NATIONAL TRAVEL SURVEY IN LONDON

To help plan for travelling in the future we need to know about the journeys people make now.

This information is provided by the National Travel Survey which is being carried out by the Office for National Statistics.

Travel is part of our everyday lives and the problems of pollution and traffic congestion are particularly acute in London, the capital city. Travel is different in London and we need your help in understanding how it can be improved for both residents and visitors. Did you know for instance that:

- About 1 million people travel to work in Central London each weekday morning.
- Sixty six per cent of workers in Great Britain usually travel to work in a car, but only 18% of those working in Central London do so.
- The average speed of traffic in Central London during the day is only about 11 miles per hour.
- Fifteen per cent of Londoners' travel is by rail (including the tube), compared with 5% for non-Londoners.
- Public money equal to £5 per person per week is spent on maintaining the capital's roads and helping to provide public transport.

That's Why We Need Your Help to tell us

- How you get to work, to the shops, to schools
- How far you travel
- How often you go on buses, trains, or by car, by bike or walk.

Your co-operation is very important to this project. One of our staff is trying to get in touch with you and will be pleased to answer any questions you have about our work, and to explain how you could help.

1 Drummond Gate
London

Any information you give will be treated in confidence. The results will not be used in any way in which they can be associated with your name or address.

No identifiable information about you or your household will be passed to other government departments, local authorities, members of the public or the press.

Is the survey confidential?

Yes - any information you give will be treated in confidence. The results will not be used in any way in which they can be associated with your name or address. Apart from statisticians and researchers in ONS and the Department of the Environment, Transport and the Regions no identifiable information about you or your household will be passed to other government departments, local authorities, members of the public or press.

Is the survey compulsory?

No - as in all our surveys we rely on people's voluntary co-operation which is essential if our work is to be successful. By taking part in this survey you are making a contribution that benefits everyone. Your co-operation is very much appreciated.

What is the Office for National Statistics (ONS)?

ONS, is the government department which gathers together and publishes a range of statistics about the society in which we live and about the economy. It is also the Office of the Registrar General for England and Wales.

ONS includes the Social Survey Division which carries out many important government surveys throughout Great Britain, providing information on the cost of living, health, housing and many other matters of public interest.

ONS has a wide range of other responsibilities, including

- the registration of births, marriages, and deaths*

- providing population and health statistics*
- carrying out the census of population*
- providing statistics on employment and unemployment
- providing statistics on businesses, and the nation's finances and economy

If you would like any further information about ONS, please telephone the Central Enquiry point on 0171 533 5500.

* In Scotland these functions are carried out by the Scottish General Register Office.

We hope that this leaflet shows you how important the National Travel Survey is and how the information collected can be of benefit to everybody.

Thank you for helping us.

The National Travel Survey

The National Travel Survey is being carried out by Social Survey Division of the Office for National Statistics on behalf of the Department of the Environment, Transport and the Regions.

HA13/4 11/98

What is the survey about?

The government makes many decisions about travel and transport services and to do this it needs up-to-date and reliable information. A sensible way to get this is to ask people themselves about their travel and the National Travel Survey has been doing this since 1965.

The information which you and several thousand other households provide, gives a picture of different kinds of transport people use, distances, where people travel to and from and for what purposes, and what kinds of people travel and how often.

How is the information used?

The National Travel Survey is used to build up a picture of different kinds of traveller such as car users or bus users, and to examine travel among particular groups of people in the community such as the elderly or the disabled. For example, the information collected is used to calculate how many people who are entitled to concessionary fares, actually make use of them. The survey also helps to find out the transport needs of people in getting to work, to the shops, to school, and for social purposes such as visiting friends and relatives.

Because the survey is carried out during every week of the year, changes in travel behaviour and changing needs can be measured. Furthermore it is the only source of national information on subjects such as cycling or

walking, and it contributes to discussions on the environment. The survey also allows estimates to be made of annual vehicle mileage and vehicle fuel consumption.

The main results of the survey are published and so are available to anybody interested in travel and transport.

Some facts and figures from the National Travel Survey

- * Nowadays, people travel nearly four times as far, on average, as they did in 1950.
- * On average people spend about as much on travel within Great Britain, as they do on housing - about 15p in every pound.
- * In 1995/97, the average person spent over 2 weeks (or 1 hour a day) each year travelling within GB. About 9 days were spent in a car, about 3 days were spent walking and 2 days in total were spent on bus and train services.
- * About two thirds of all households in Britain have the use of a car or light van.
- * In 1994/96, adult men travelled over 9,000 miles on average each year compared to less than 6,000 miles for adult women. Children travelled an average of 3,800 miles a year.

- * One car in thirteen (7%) in GB is a company car. In 1995/97, company cars were, on average, driven nearly 22,000 miles compared to just over 8,000 miles for private cars.
- * In 1995/97 on average households spent 13% of their total expenditure on motoring costs. (£41 per week).
- * The average distance walked per person per year fell from 255 miles in 1975/76 to 195 miles in 1995/97, a fall of about 24%.
- * The average distance cycled per person per year fell from 51 miles in 1975/76 to 37 miles in 1995/97.
- * Figures for 1995/97 show that 81% of men and 57% of women held a full car licence compared with 63% of men and 21% of women in 1972.

How was your household chosen?

The households in the survey have been chosen by taking a representative national sample of addresses from the Postcode Address File, that is, the Post Office's own list of addresses. We then approach the people who happen to live at those addresses. To make sure that travelling done by all types of household is properly represented, **it is important that everyone selected helps us by giving the necessary information. To obtain a true picture we need to include people who make a lot of journeys, few journeys, or even no journeys at all.**

A National Statistics publication

Official statistics bearing the National Statistics logo are
produced to high professional standards set out in the National
Statistics Code of Practice. They undergo regular quality
assurance reviews to ensure that they meet customer needs.
They are produced free from any political interference.

About the Office for National Statistics

The Office for National Statistics (ONS) is the government
agency responsible for compiling, analysing and disseminating
many of the United Kingdom's economic, social and
demographic statistics, including the retail prices index, trade
figures and labour market data, as well as the periodic census
of the population and health statistics. The Director of ONS is
also the National Statistician and the Registrar General for
England and Wales, and the agency administers the statutory
registration of births, marriages and deaths there.

Acknowledgements

Thanks are due to the headquarters staff and interviewers in Social Survey Division of ONS whose consistent hard work has led to the success of the survey. Thanks, of course, are also due to the staff at the Department for Transport, Local Government and the Regions for their advice, guidance and support.

Chapter 1 Introduction

1.1 Background

The National Travel Survey (NTS) provides regular, up-to-date data on personal travel and monitors changes in travel behaviour over time. The first NTS was commissioned by the Ministry of Transport in 1965/66. Further periodic surveys were carried out in 1972/73, 1975/76, 1978/79 and 1985/86. In 1988 the NTS became a continuous survey with field work being carried out every month of the year.

Social Survey Division (SSD) of the Office for National Statistics (ONS) carried out the NTS in 1972/73 and 1985/86 and has been the contractor for the continuous NTS since its launch in 1988. SSD is responsible for questionnaire design, sample selection, data collection, data editing and data file production. Analysis and report production are carried out by the Department for Transport, Local Government and the Regions (DTLR), the commissioning department for the survey. An edited database is sent to DTLR every 3 months and is produced 2 months after the end of fieldwork.

This report describes the methodology of the 2000 NTS. It is intended as a working reference manual and describes the sample design, fieldwork methodology, data production and data file production.

1.2 Uses of the NTS

The NTS provides detailed information on different types of travel; where people travel from and to (at county level), distance, time, purpose and what kinds of people are doing the travelling and how often. The NTS is the only source of national information on subjects such as cycling and walking which provide a context for the results of more local studies.

The results of the survey are published by DTLR and are available to users both within and outside Government. Travel research institutes such as the Transport Research Laboratory (TRL) view the NTS as one of their major data sources and the NTS datasets are deposited at the Data Archive at the University of Essex. Details on the use of the NTS are presented in Figure 1.1.

1.3 Sequence of work on the NTS

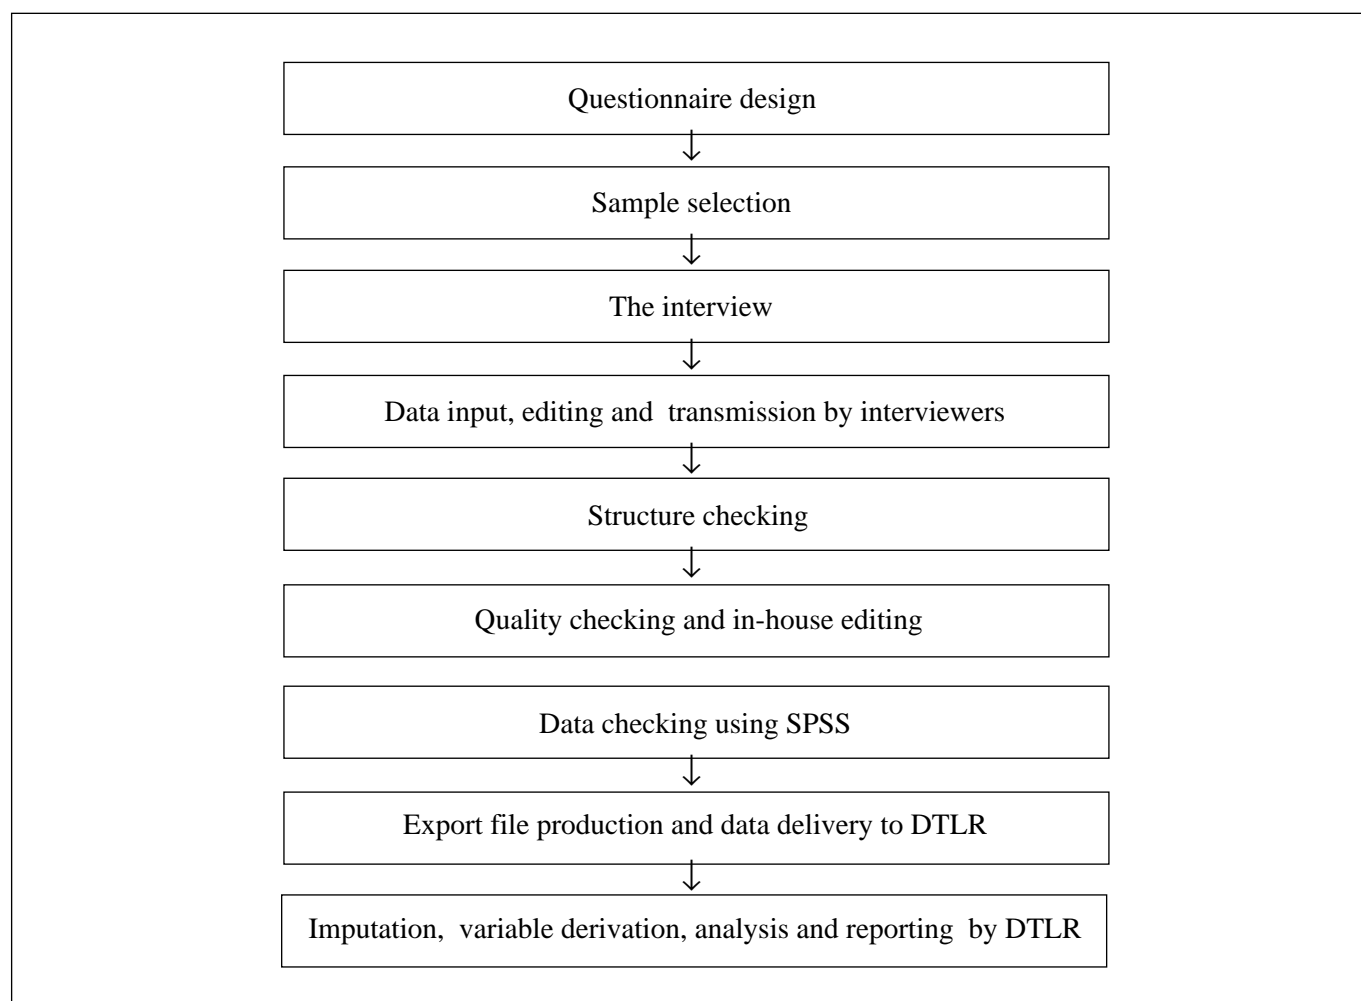

The NTS collects data using two methods: face-to-face interviewing carried out using computer assisted personal interviewing (CAPI) and seven day travel diary keeping. The sequence of tasks carried out on the 2000 NTS is summarised in this section and in Figure 1.2. Details on individual procedures are set out in the remainder of the report.

Figure 1.1 Uses of the NTS

The DTLR has used the NTS to:

- build up a general picture of changes in personal travel over time, for all modes including walking, cycling, car and public transport
- examine travel among special groups in the population such as children, the elderly or disabled
- estimate accident rates on the basis of exposure to accident risk for different groups in the population
- establish the level of take up of concessionary fares among those entitled to such fare schemes such as the elderly
- estimate annual mileage for cars (as opposed to other light vehicles such as taxis or vans); this information is used when road tax and fuel tax payments are under consideration
- estimate the effect that a change in this balance of road tax to fuel tax would have on different kinds of households
- examine changes over time in travel for different purposes, such as commuting, business, education, shopping and leisure
- collect information about whether people use leaded or unleaded petrol or diesel in their vehicles
- assess the extent to which tax concessions available to those with company cars encourage extra mileage
- examine the relationship between the level of car ownership and the level of bus patronage at regional level
- examine car ownership levels and the availability of bus services in rural areas.

Figure 1.2 Sequence of work

1.3.1 Sample selection

The NTS is based on a random **sample** of private households. The 2000 sample size was 5,796 addresses drawn from the **Postcode Address File**. The addresses selected were allocated into interviewer quotas in such a way that each quarter's sample was nationally representative.

1.3.2 The interview

In advance of the interviewer's first call, letters were sent to the sampled addresses. These letters introduced the survey and explained that an interviewer would call shortly.

The NTS sampled allocation month ran from mid-month to mid-month. The interviewer would usually start to make contact with the household at the beginning of the calendar month in which the seven day

diaries (travel records) would be kept. A **placement call** would be set up prior to the start of the record keeping week (**travel week**) specified for that household. At the placement call, the interviewer would conduct an interview. After the interview, the interviewer explained the travel record keeping procedure in detail.

The placement call was generally followed by a **reminder call**, just before the start of the travel week, to remind the household to begin their travel records, and by a **midweek checking call** during the travel week to check that the records were being completed correctly.

The interviewer made a **pick-up** call to collect the travel records and to check the information recorded with the informants. A few additional questions were also asked. The pick-up call was made within six days of the end of the travel week. Figure 1.3 summarises the calls made to a household.

Figure 1.3 The interview

1.3.3 Data input and editing during the field work period

Working at home, the interviewer transferred and coded the travel information from the **travel records** to the **computerised Journey Input System**. Any inconsistencies identified at this stage were corrected by the interviewer and, if necessary, checked with the informant.

The interviewer then ran the **journey checking program** (pre-specified consistency and plausibility checks) and made the appropriate amendments, again checking back with informants where necessary or referring to the interviewer instructions.

Throughout the field period SSD staff monitored the progress of interviewer's work and answered coding and technical queries.

On a weekly basis interviewers transmitted data to ONS office. Any paper documents were returned by post at the end of the field period. The final transmission and posting date was the 28th day of the month in which field work was completed.

1.3.4 Final data editing and checking and data file production

The transmitted data were structure checked to make sure that all the data transmitted by the interviewers had been received. All returned paper documents were also checked.

Some final coding and checking was then carried out in the office. Manual recodes and interviewer's notes were scrutinised. Quality checks were also made on selected interviewers on a rota basis.

The data were organised into seven record types and sent to DTLR on a quarterly basis. The seven record types consisted of: households, individuals, vehicles, long distance journeys made before start of the seven-day Travel Week (two records), journeys made during the Travel Week and stages of the journeys made during the Travel Week.

1.4 Response

Only households classed as 'fully co-operating' were included in the response calculations.¹ In 2000 a national response rate of 64 per cent was achieved.² Under the current contract, the DTLR measures response according to Achieved Sample Rates (ASRs). Unlike the usual SSD response measure, ASRs include sampled addresses classified as 'ineligible' in the denominator.³ In 2000 a national Achieved Sample Rate of 57 per cent was achieved.

Notes

1. See 3.7.4 for a description of the term 'fully co-operating'.
2. The response data in this report are provisional figures produced from the ONS Field Case Management System. They may differ slightly from the final figures on the analysis database.
3. See Section 2.3.2 for the definition of an ineligible address.

Chapter 2 Sample Selection

2.1 The sample requirements

The survey is required to provide a comprehensive picture of personal travel behaviour by people living in private households in Great Britain. The sample was designed to provide a representative sample of households in Great Britain. The NTS has an annual two-stage set sample of 5,796 addresses with each member of each household providing information about journeys made in a pre-selected seven day period (the travel week). As travel behaviour varies considerably depending on the month of the year or day of the week, interviewing and travel record keeping were spread evenly over the year. Most analysis are carried out on three years data combined, making the total set sample size similar to that of each of the previous periodic surveys. A base of over fifteen thousand provides the degree of precision required by DTLR.

2.2 Sample design

2.2.1 The sampling frame

The NTS is based on a random sample of private households. The sampling process is carried out by the Sampling Implementation Unit (SIU) at ONS. The sample is selected using the 'small user' Postcode Address File (PAF), as a sampling frame. The PAF is constructed by the Post Office as a list of all addresses (delivery points) in the country. The 'small user' Postcode Address File is the file of delivery points which receive fewer than 25 items of mail each day. By using the small user file most large institutions and businesses are excluded from the sample.¹ However, some small businesses receive fewer than 25 items of mail a day and are included in the small user PAF so they may have been sampled. These were recorded as ineligible addresses by the interviewers, although interviewers were asked to call at the sampled address in order to check that no private household could be found at the address.

The version of the small user PAF used for selecting the sample is up-dated twice yearly and is specially adapted for use by ONS. The adaptation involves adding information from the Central Postcode Directory (CPD) held at ONS. Examples of the information added are Local Authority codes, wards, grid references and data from the census. A match is also made with the National Health Service Users Postcode

Directory (NHSUPD), also held at ONS, in order to add Health Authority codes. Addresses previously sampled for the NTS or for any other ONS social survey cannot be sampled for a period of three years.

2.2.2 Sampling procedures

In order to select the appropriate number of addresses, a stratified multi-stage random probability sample was used. There were two stages in the sample selection - the sampling of primary sampling units (PSUs) followed by the sampling of addresses within the selected PSUs. The PSUs were in the form of individual or groups of postcode sectors which contained an average of about 2,900 delivery points. Postal sectors south of the Caledonian Canal with less than 500 delivery points were grouped with contiguous sectors so that the minimum size of a group was 500 delivery points. The minimum size of a group of sectors north of the Caledonian Canal was 250.

Postal sectors covering Scottish Islands and the Isles of Scilly were excluded, as in other major Government surveys (see Table 2.1). The effect of this was to exclude 2.2 per cent of the delivery points in Scotland, and about 0.2 per cent of delivery points in the whole of Great Britain.

The sample is drawn biannually. 252 PSUs were selected in total in 2000, 21 per month; 23 addresses were drawn from each selected PSU.

A way of increasing the precision of a random sample is to stratify it. Before any selection takes place, the population is divided into a number of strata; then a random sample is selected independently within each strata. This ensures that different strata in the population e.g. regions, are correctly represented. This will also lead to a reduction in standard error.

The 2000 NTS sample was stratified using a regional variable and two PSU-level variables derived from the 1991 Census. The regional variable divides Great Britain into 20 regions. Wales forms one region, Scotland is split into two regions (Strathclyde and the remainder of Scotland), and there are 17 regions based on the nine Government Office Regions of England. In England, inner and outer London, and the former Metropolitan Counties are separately identified within the nine Government Office Regions. (Table 2.2).

Table 2.1 Areas omitted from the sample

Region	ONS code and Local Authority name	Name of areas excluded
Southwest	15UH Isles of Scilly	Isles of Scilly
Scotland	71UE Lochaber 78UH Cunninghame 71UH Skye/Lochalsh 78UP Argyll/Bute	Mallaig, Inverie, Soay, Eigg, Muck, Rhum, Canna. Arran, Great/Little Cumbrae. Whole authority. Bute, Oban/neighbouring islands, Gigha, Islay, Colonsay, Mull(pt).
Jura/	80UB Orkney 81UB Shetland 82UB Western Isles	Whole authority. Whole authority. Whole authority.

Table 2.2 The relationship of GOR6 to Government Office Regions (GOR)

GOR6 codes	Government Office Region	GOR codes	No. of PSUs
0	Exclusions (Scottish islands)	0	
1	North East Met	1	5
2	North East Non Met	1	6
3	North West Met	2	11
4	North West Non Met	2	12
5	Merseyside	3	6
6	Yorks and Humberside Met	4	14
7	Yorks and Humberside Non Met	4	7
8	East Midlands	5	18
9	West Midlands Met	6	11
10	West Midlands Non Met	6	11
11	Eastern Outer Met	7	10
12	Eastern Other	7	13
13	London Inner	8	18
14	London Outer	8	21
15	South East Outer Met	9	14
16	South East Other	9	19
17	South West	10	21
18	Wales	11	12
19	Strathclyde	12	10
20	Scotland excluding Strathclyde*	12	13

* Excludes Scottish Islands. Includes mainland North of Caledonian Canal.

Within each of the 18 regions the PSUs were ranked in order of the proportions of households with no car and then split into three bands. Within each band the PSUs were ranked in alternate descending/ascending order by the proportion of heads of households in socio-economic groups 1 to 5 and 13 (that is a professional employer or manager). The PSUs were then sampled using a form of systematic sampling to produce a stratified sample.

The number of postcode sectors sampled was fixed in London, but elsewhere, it was proportional to the size (number of delivery points) of the region and was obtained by means of the following formula:-

$$\frac{\text{No. of delivery points in the region} \times 206}{\text{No. of delivery points in GB outside London}}$$

The aim was to give each household outside London an equal chance of selection. In London, the number of PSU selections was fixed at 15 in Inner London and 19 in Outer London. This ‘over-sampling’ in London was carried out in order to provide sufficient numbers for DTLR’s particular analysis interest in the area, as response rates in London are lower than elsewhere.

In Great Britain as a whole around 24 million delivery points were available for possible selection with just under three million delivery points in the Greater London area. This means that nationally there was a one in 4,194 chance of an address being selected in the year; in Inner London a one in 3,383 chance of selection, and in Outer London a one in 4,092 chance.

If there is more than one household or business receiving mail at an address an adjustment will need to be made. The Post Office attaches an indicator (the Multi Occupancy Indicator or MOI) to show this. The MOI is intended to indicate the number of ‘letter boxes’ at the address. A shop with a flat above may have an MOI of two. In general, an MOI of three or more indicates a multi-household address. However, methodological work conducted within SSD has shown that this is only reliable in Scotland.² So in Scotland, addresses with an MOI of three or more were given a chance of selection equal to the MOI. In England and Wales the standard SSD multi-household procedures were used at addresses found to contain more than one household in order to ensure that all households were given an equal chance of selection.³ These procedures were carried out by interviewers at the fieldwork stage. All SSD interviewers are carefully trained in the use of these procedures the details of which are described in Section 2.3.

2.2.3 The allocation of PSUs to interviewer quotas

To reduce unnecessary travelling between addresses by the interviewers, all the addresses selected in a PSU were allocated as a single quota of work for an interviewer. In order to obtain a nationally representative sample for each quarter of the year the PSUs were allocated to quota months such that:

- a total of 21 selections were assigned to a month
- the correct number of PSU selections were made in each major stratum over the year
- the number of PSUs selected per major stratum was as equal as possible from month to month.

A listing of the PSUs allocated to each of the twelve quota months can be found in Appendix C.

2.3 Field sampling procedures

2.3.1 Multi-household procedures

Section 2.2.2. mentioned that the 2000 NTS used the standard SSD multiple-household procedure to ensure that all households at multi-household addresses had an equal chance of selection. These procedures were the:

- pre-sampled multi-household procedure
- concealed multi-household procedure.

These procedures are described in full in the NTS Interviewer Instructions. The key points are summarised below.

The pre-sampled multi-household procedure

The pre-sampled multi-household procedure was used at addresses in Scotland with a Multi Occupancy Indicator (MOI) of more than two. Interviewers were instructed to use a selection grid which will select 1 in n households (n being the value of the MOI). Occasionally a pre-sampled multi-household address contained fewer households than the value of the MOI. In such cases, no household would be selected; the selection grid would indicate to the interviewer that no interview was to be completed at the address and the interviewer would return the address as ‘directed not to sample any household at the address’.

The concealed multi-household procedure

The concealed multi-household procedure was used where interviewers came across multi-household addresses in England and Wales, and also at addresses in Scotland with an MOI of one. At these addresses interviewers were instructed to include all households up to a maximum of three. At addresses with more than three households interviewers used concealed multi-household selection grids to select three from the number present.

To limit the extent to which an interviewer’s quota could be inflated by the occurrence of several concealed and/or pre-sampled multi-households, interviewers were instructed to interview at no more than four extra households from concealed and/or pre-sampled multi-household addresses. This approach may have introduced a very slight bias against households in concealed multi-household addresses but the effect of this is likely to be negligible.³

2.3.2 Ineligible addresses

Three types of addresses were classified as ineligible for the NTS:

- Non-residential addresses and institutions (i.e. residential addresses that did not contain a private household). An institution was defined as: ‘an address at which four or more unrelated people slept; while they may not have eaten communally, the establishment must have been run by a person (or persons) employed for this purpose, or by the owner’. Private households with separate accommodation within an institution were included in the survey.
- Residential accommodation not used by a household as their main address (e.g. a holiday home or second home). This group was excluded to avoid double counting - households occupying these accommodation had already had a chance of selection at their permanent address.

- Addresses in the PAF that did not exist because they had been demolished, not yet been built, or perhaps two converted flats had been recombined into one house.

2.4 PSU level variables

Fourteen of the survey variables were measured at PSU level (P level). A value on a P-level variable applies to all households living within that PSU. The P-level is therefore the highest level at which the data of the continuous survey may be analysed, coming just above the H (Household) level in the analysis hierarchy. Unlike almost all other variables in the survey, the PSU variables were not derived from information provided by members of the sampled households. Details on the derivation of the variables are given in Table 2.3. A detailed description of the PSU-level variables is given in the 1997 NTS Technical Report.⁴

Table 2.3 Description of the P-level variables

Variable	Description
P1	The Area Number - identification number for the PSU laid down in the sample design.
P2	Describes the category of planning region (Scotland, Wales and the eight Standard Statistical Regions of England).
P3 - P4	Left blank for the use by DTLR.
P5	Type of area - P5 was constructed from a classification of urban areas derived by ONS and DTLR from the 1991 Census of Population.
P6	PSU population density derived from population density figures supplied by ONS.
P7	Local authority population density derived from population density figures supplied by ONS.
P8-P14	This information was obtained by DTLR from a questionnaire sent to all local authorities in Great Britain in 1995/96.*
P8	Availability of concessionary bus fares schemes for pensioners.
P9	Eligibility for concessionary bus fares schemes for pensioners.
P10	Type of concessionary bus fares schemes for pensioners.
P11	Membership fee for concessionary bus fares schemes for pensioners.
P12	Times available for concessionary bus fares schemes for pensioners.
P13	Geographical area covered by the concessionary bus fares schemes for pensioners.
P14	Additional modes of public transport covered by the concessionary fares scheme for pensioners.

* Concessionary fare schemes in Great Britain in 1995/96, DETR (1997).

Notes

1. The characteristics of the PAF as a sampling frame are described in the paper 'An evaluation of the PAF as a sampling frame and its use within OPCS' Wilson P and Elliot D, *The Journal of the Royal Statistics Society Series A* (1987).
2. 'Multi-household procedures for social survey', Barton J, *Survey Methodology Bulletin No. 40* (1997) ONS.
3. 'Office and field procedures for dealing with multi-household addresses', Dodd T, *Survey Methodology Bulletin No. 5* (1979) ONS.

Chapter 3 Field Work procedures and response

3.1 Introduction

The 2000 NTS was a continuous survey with interviewing occurring every month of the year. In addition to the interview, all respondents were asked to keep a record of their travel over seven consecutive days. The travel recording period for each month (the quota month) ran from mid-month to mid-month (Table 3.1). Field work for each quota month of the survey started at the beginning of the month when interviewers contacted households to complete the interview and 'place' the travel records and was completed at the end of the following month when all the travel records had been collected and transferred by the interviewer to the computerised Journey Input System.

Since October 1994 the NTS interview has been conducted using Computer Assisted Personal Interviewing (CAPI). Blaise 4, a software system developed by Statistics Netherlands was used to write the 2000 questionnaire. On NTS, the household, individual and vehicle sections as well as the administration details were incorporated into a single Blaise data model. The Journey Input System was written in the database language 'Clipper' which was also used for data handling purposes by SSD. Both systems cross-referenced one another.¹

3.2 Questionnaire discs and despatch of documents to interviewers

Each month the sampled address lists and paper documents, such as the travel records, were despatched to the relevant interviewers from ONS. Computerised details of the addresses to be interviewed were created and then transmitted to the interviewers via a system of direct communication using modems and dedicated telephone lines. Floppy discs containing the CAPI questionnaire were compiled and posted from ONS.

Technical queries from interviewers regarding the transmission of data were dealt with by a special unit set up to deal with such matters. Laptop maintenance was handled by a separate support unit.

3.3 Public Relations

It was important that informants had complete confidence in the survey and in the interviewer. In advance of the interviewer's call, SSD wrote to each sampled address to inform them of the visit and interview content. A special leaflet designed to explain the importance of the survey to informants, and to encourage more people to take part in the survey, was also included with the advance letter.

Table 3.1 2000 quota month end dates

MONTH	From		To	
January*	11	January	9	February
February	10	February	11	March
March	11	March	11	April
April	11	April	11	May
May	11	May	10	June
June	10	June	11	July
July	11	July	11	August
August	11	August	11	September
September	11	September	11	October
October	11	October	11	November
November	11	November	11	December
December	11	December	11	January

* The survey year ran from mid-January 2000 to mid-January 2001.

As with all other ONS surveys, the advance letter informed households at the selected addresses that the survey was not compulsory and relied on voluntary co-operation. Informants were also told that any information they gave would be treated in the strictest confidence.

Interviewers were notified of any refusal made to ONS headquarters as a result of the advance letter. These 'headquarters refusals' were included in the overall refusal rate but did not count against the interviewer on the individual interviewer response scores.

Before going into the field all ONS interviewers were issued with a photo identification card. Informants had the opportunity to call ONS headquarters to establish the validity of any interviewer.

3.4 Administering the placement pattern

The principle for assigning Travel Weeks was for interviewers to allocate the first address contacted from their quota list to the first date available on their allocation card, the second address to the second date and so on. In other words, as an interviewer progressed through their quota, the number of travel weeks available became less. If an address was ineligible, or the household refused to take part in the survey, their allocated date was not used.

Travel Weeks were spread across four periods, three of which were allocated five addresses and one allocated six addresses. In exceptional circumstances, such as not being able to contact a household or a household being away but willing to participate, interviewers used a 5th allocation period. This being the first allocation period of the following month. Each address was assigned one date for the start of the travel week which was selected at random by the computer.

3.5 The interview

The NTS interview at each household could be divided into a strict sequence of events:-

- the placement call
- the reminder call
- the mid-week checking call
- the pick-up call

The initial interview was carried out at what was termed the 'placement call'. At this call the interviewer explained the purpose of the survey, ideally to

the entire household, and gained the co-operation of the entire household. The interviewer then asked the head of household or partner questions about the household composition, the household's vehicles and some general background information. Questions were then asked of each individual in the household including children and babies (although for children under the age of 11 the interviewer generally talked to the parent as well as the child). Questions were also asked about each household vehicle from the person best able to give that information (usually the main driver). The interviewer introduced and placed the seven-day Travel Record, and where appropriate, a chart to enter fuel and mileage details for each vehicle in the household and for long distance travel. Interviewers took time to explain in detail how to record journeys made during the travel week and talked the informants through some examples, explaining what to include and what not to include and described the survey definitions, for example, usual place of work, in course of work etc. Pocket size diaries were occasionally handed out to help informants record details of their journeys. In addition, an NTS pen was left for each household member to aid the completion of the fuel and mileage chart and an NTS fridge magnet was left with each household (for public relations purposes).

When there was a gap of more than a day or two between the placing call and the start of the travel week, the interviewer made a reminder call, either by telephone, post or in person to the household. Interviewers were encouraged to make the call in person where they were concerned about a particular household's commitment to diary keeping.

Sometimes the interviewer would make an additional mid-week checking call on a household part way through the travel week to help with problems and encourage accurate record keeping. This call was made at the interviewer's discretion when she/he judged that informants needed encouragement or assistance with record keeping. Again, interviewers were encouraged to call in person.

Pick-up calls were made within six days of the end of record keeping. Interviewers were instructed to target households where they were uncertain of the informant's ability to maintain accurate records and make those pick-up calls within one or two days of the end of record keeping. The interviewer collected the travel record of each household member and checked the contents with the informant. The interviewer also asked some additional questions about any vehicles acquired since the placement interview, whether a

provisional or full driving licence or season ticket had been acquired and also about any long distance journeys made between placement and the start of the travel week. These questions were also asked using a Blaise CAPI questionnaire. Fuel and mileage charts were also collected and information about vehicle mileage and fuel gauge details were entered into the CAPI questionnaire either during the pick-up interview or later, by the interviewer at home.

3.6 The 2000 NTS questionnaire

3.6.1 Questionnaire structure

The structure of the 2000 questionnaire is set out in Figure 3.1. A maximum of 10 people, 10 vehicles and 40 long distance journeys per person could be included in any one household interview. When an interviewer encountered a household larger than this a second household would have been opened and the data stored separately to be merged after structure checking, back at the office.

The NTS continuous dataset is usually analysed in three year periods (1989/91, 1992/94, 1995/97, 1998/2000), so it has been convenient to introduce new variables at the start of each new three year period, in 1992, 1995, and 1998. Consequently there were few changes to the questionnaire in 2000.

The text of the 2000 questionnaire is set out in Appendix A. The key differences between the 2000 and 1999 questionnaires are set out below.

Individual level questions:

- Three new cycling questions were added which asked about ownership and where any bicycles were mainly used.

Household level questions:

- Addition of new harmonised accommodation questions.

Unitary Authorities

In April 1998 the final Unitary Authorities (UA) were introduced in England. The National Travel Survey now codes Unitary Authorities and type of area (classification of urban areas) as well as counties in England, Scotland and Wales on three different parts of the questionnaire: origin and destination codes for long distance journeys; place of work; and origin and

destination on the diary journeys. Coding of county UA, and area type for these questions is done using a frame consisting of approximately 4500 place names. Places not contained within a new UA were coded with the county only for both fields.

3.6.2 Harmonised Questions

Harmonised questions were introduced to the NTS to allow users to compare NTS data with those from the other government social surveys³. These replaced similar questions previously used in the NTS. A number of harmonised questions are used in the 2000 NTS and are detailed in Figure 3.2.

3.7 Post interview coding and checking

After collecting the information and material from households at the pick up call, interviewers transferred the data from the travel records into the computerised Journey Input System, coded the occupation, industry and socio-economic group of each informant aged 16 and over and the interview outcome for each household.

3.7.1 Transferring the data from the travel records

At the interviewer's home the data from the travel records were transferred to the Journey Input System written in the database language Clipper. This was basically a straightforward data entry operation where the information was simply copied across onto the interviewer's laptop computer. The system was designed to match the travel records layout exactly. Any inconsistencies identified at this stage were corrected by the interviewer, if necessary checking with the informant. The interviewer then ran the journey checking program comprising pre-specified consistency and plausibility checks and made appropriate amendments, again checking back with informants where necessary or referring to coding instructions.

3.7.2 Socio-economic group and industry coding

The occupation of informants aged 16 or over and who had ever worked were coded using the Standard Occupational Classification (SOC) (1990). Industry information was coded using the Standard Industry Codes (SIC) (1992). Details of the classifications are set out in Table 3.2.

The NTS used the standard SSD closed census matrix which derives Socio-economic Groups (SEG) and Social Class from the standard occupation (SOC) and employment status codes. Where the combination of SOC and employment status was invalid, eg. self-

employed policeman, the matrix would impute the ‘most likely’ SEG and social class according to standard priority rules. A signal in the Blaise instrument indicated when the combination was invalid. If the signal was suppressed by the interviewer, SEG and social class would be automatically imputed.

3.7.3 Coding the outcome for each household

Households eligible for interview were divided into 3 categories for outcome coding purposes: fully co-operating households, partially co-operating households and non-responding households.

A household was coded as ‘fully co-operating’ if there was complete journey information for each individual in the household and the bulk of the rest of the information was present. The majority of all of the following sections should have been completed:

- the household section
- an individual section for each person listed in the household box
- a vehicle section for each vehicle listed in the vehicle grid
- all journeys for each person entered into the journey input system and checked fully.

A ‘partially co-operating’ household must have had at least a household questionnaire completed. A household would be included as ‘partially co-operating’ if any journeys were missing.

An eligible household was said to be ‘non-responding’ if the household had refused to take part in the survey or the household was away for the whole of the interviewing period and the interviewer was unable to make contact.

Figure 3.1 The structure of the questionnaire

Section	Subject
Household	Household box. Placement and Travel Week dates. Background questions. Availability of public transport. Access to amenities Number of household vehicles. Vehicle Grid.
Individual	Who interviewed and in what order. Disability section. Frequency of use of various methods of transport Driving licences and type of vehicle driven. Employment, Occupation and Industry details, Income. Place of work and travel to work. Season ticket details. Any long distance journeys made. Long distance journey information. Recall question.
Vehicle	Introduction. Registration details. Parking. Vehicle subsidies. Mileage. Pick-up questions from fuel and mileage chart.
Admin. block	Calls and contact information. Occupation, Industry and Outcome coding. Reasons for refusal.
Journey input and editing system	Journey data input and error checking program.

Interviewers also had to assign an outcome code (Table 3.3) to the households they had classified as ineligible using the criteria set out in Section 2.3.2. The code the interviewer would assign to an ineligible household was dependent on the reason for its ineligibility.

3.7.4 Interviewer query service

In the past one person would have closely supervised the office editing process thereby minimising coding and editing bias. Under CAPI interviewers carried out the editing procedure. In order to reduce variability

and possible bias among interviewers a service was provided whereby interviewers could report queries relating to survey definitions or coding. The queries were handled by the NTS field co-ordinator who could obtain an overview of all interviewers' work. Any queries not covered by the instructions were referred to the research officer and displayed on the NTS electronic bulletin board. If necessary, the research officer would contact DTLR. The query service therefore ensured that central control was maintained over editing decisions.

3.8 Response

Tables 3.4, 3.5 and 3.6 show the national response rate for the period mid-January 2000 to mid-January 2001 and the London response rate for the same period.

During 2000 the NTS maintained a response rate nationally of 64 per cent. The response rate achieved in the Inner and Outer London areas were 50 per cent and 58 per cent respectively. The DTLR measured

response according to Achieved Sample Rates (ASRs) which included sampled addresses classified as 'ineligible' in the denominator. Achieved sample rate calculations are also shown in Tables 3.4 to 3.6.

Notes

1. A detailed description of the conversion to Computer Assisted Personal Interviewing and the development of the journey input and editing system is given in Chapter 3 of the 1994 NTS Technical Report.
2. All the NTS definitions are set out in the NTS Definitions Manual (copies available on request).
3. *Harmonised Concepts and Questions for Government Social Surveys*, Government Statistical Service, 1996, London, ONS and *Harmonised Concepts and Questions for Government Social Surveys – update December 1997*, Government Statistical Service, 1998, London, ONS.

Chapter 4 Data Processing

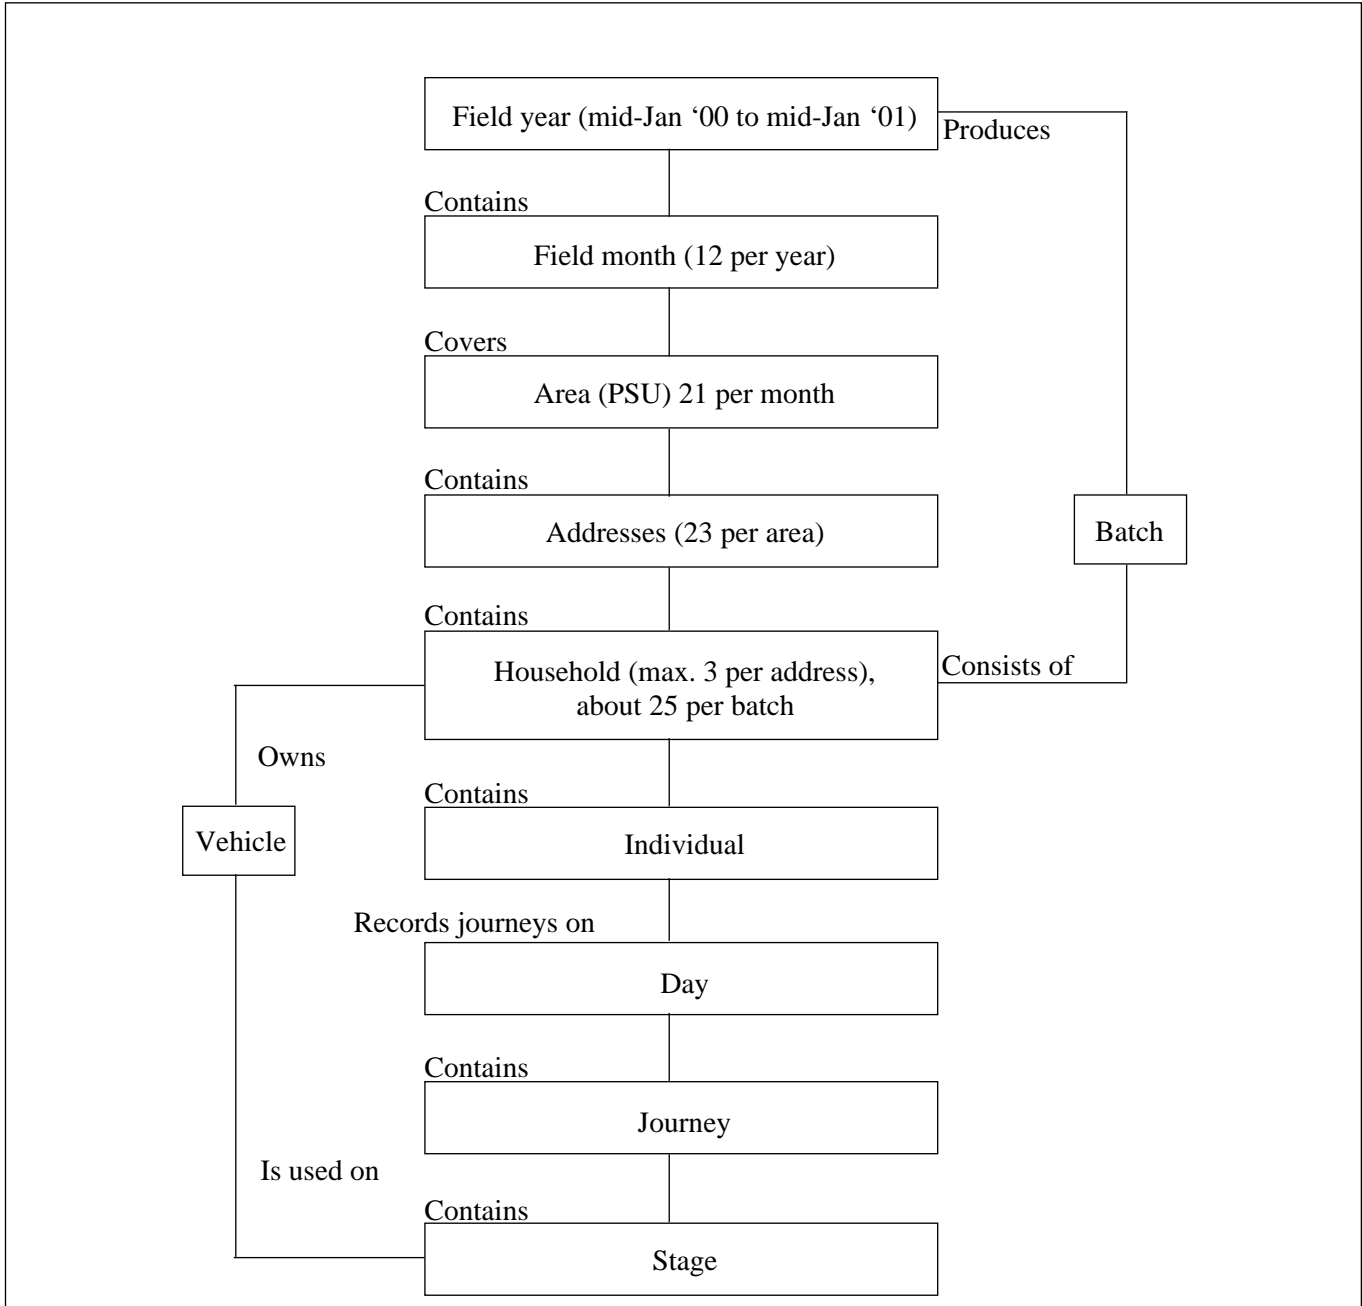

4.1 Data transmission and despatch of paper documents from interviewers

On a weekly basis interviewers transmitted data to ONS. To ensure security, the data were encoded before transmission. Any paper documents were posted to ONS at the end of the field period. The final transmission and posting date was the 28th of the month in which field work was completed.

4.2 Downloading and structure checking

In order to download data transmitted by interviewers into a single dataset, a program was run which unzipped, aggregated and added interview data together. A procedure for checking the data was then implemented. This procedure checked for blank, deleted and duplicated records and reported errors. It also carried out structure checking of the data to make sure that journey information had been coded in accordance with the household outcome coding. Data structure details are set out in Figure 4.1.

Figure 4.1 Data structure

4.3 Data editing

Following the move to CAPI, almost all of the old paper editing system was incorporated into the CAPI program and carried out by interviewers. Some follow-up work was, however, conducted after ONS had received the transmitted data using a separate Blaise program. A brief description of the in-house coding and editing procedure is given below. Further details of the checks and coding carried out by the editing staff are given in the NTS headquarters editing instructions.

4.3.1 Interviewer's notes and suppressed checks

At any time during the interview interviewers were able to open a note using the Blaise note book facility. All interviewer notes created in this way were printed on the NTS fact sheet accompanying each household. Most notes contained an explanation of why an interviewer had suppressed a particular error message and may not have required any action from the HQ editor. However, sometimes interviewers may have been unsure about how to code a question, for example, the type of season ticket or area travel card used, and would record the name of the ticket and further details in the Blaise notebook. The editors were then able to check the interviewer's coding or recode if necessary.

4.3.2 Coding

i) Re-coding

Wherever the interviewer had recorded an 'other specify' answer the editor would be required to either re-code to one of the pre-specified answers or leave in the 'other specify' category. A decision would be made based on information recorded by the interviewer in the Blaise note book or in a separate text variable.

ii) Make and model coding

Where a particular vehicle make and model was 'not listed' in the make and model coding frame editors were required to allocate a code back in the office.

iii) Fuel tank size coding

The fuel tank size for most vehicles was automatically coded using the vehicle's make and model information. Editors were only required to enter the exact size of the vehicle's fuel tank for vehicles not listed in the make and model coding frame or if the informant had been unable to provide the information.

iv) County, unitary authority and area type coding

Where interviewers had been unable to allocate a code for county, unitary authority or area type, for usual place of work or journey origin and destination, editors were required to allocate the correct code.

4.4 Data conversion

The data was organised into seven record types according to the requirements of DTLR (Table 4.1): households, individuals, vehicles, whether made long distance journeys, long distance journeys details, journeys and stages. Missing values were interpreted as 'no answers' (-8) and 'does not apply' (-9). Final checks were made by ONS research staff at the aggregate level using SPSS to ensure the accuracy of the data. The files were then converted to ASCII format and sent to DTLR by e-mail.

Table 4.1 Record types

Record type	Data	Level
Record 1	Households	Household
Record 2	Individuals	Individual
Record 3	Vehicles	Vehicle
Record 4	Whether made long distance journeys	Individual
Record 5	Long distance journeys (LDJ) made before the Travel Week	LDJ
Record 6	Journeys made during the Travel Week	Journey
Record 7	Stages of journeys made during the Travel Week	Stage

Chapter 5 Analysis Variables in the 1998/2000 NTS Database

5.1 Introduction

This chapter contains a detailed description of the variables on the 1998/2000 NTS database – part of the continuous survey dataset which dates back to July 1988. General advice on the structure of NTS variables is given in Section 2 of the Technical Guide to the 1985/86 NTS.¹ Changes between 1985/86 and 1998/2000 have been minor (see Chapter 6) and the Technical Guide for 1985/86 is, in most part, still valid.

The key points about the structure of the NTS database are summarised below:

- The data are held on computer as a set of data records, each providing information for the subject of the record type, such as a household, a person or a vehicle.
- There are about 200 main variables and these are held at one of eight levels: area, household, vehicle, individual, long-distance trip, day, trip and stage. Data from different levels can normally be linked together, though matching trip stages to household vehicles used in the stages can be difficult. Household vehicles are linked to main drivers, i.e. the individuals that drive the most mileage in the vehicle over a year.
- Some variables, called numerical variables, are unbanded. They include such data as age and stage distance. They may be used within tables to give estimates, e.g. of travel distance by mode of travel. They may also be used to create other banded or unbanded variables by recoding or by aggregation. Each numeric variable has an associated banded variable, (normally with a variable number 1 greater than the unbanded one) which holds the information in grouped form, e.g. j33 bands trip times in 14 categories from 'Less than 3 minutes' to '6 hours and over', whilst j32 is the numeric variable running from 1 minute upwards.
- There is no multi-coding on any main variable. Some variables, e.g. on suggestions for improving bus services or special tickets/passes, are spread over more than one variable for those giving two or more suggestions.
- Missing data are normally imputed, or patched, on the NTS, using procedures that

were described in some detail within Section 4 of the 1985/86 Technical Guide.¹ Where patching is done by reference to the nearest record, this implies that region of residence and possibly type of area are also necessarily used in the imputation process. Thus, most 'Not available' (NA) categories for the variables listed below are shown as having a nil frequency. In unbanded variables, missing data generate zero values and so must be excluded from counts of the variable.

- Filters can be used in the specification of tables to restrict analyses to key records, e.g. those aged under 16.
- The only reweighting routinely carried out for analyses is that for short walk trips and short walk stages. This is because the information was only collected on the last day of the travel diary week and so the data must be reweighted by a factor of 7. Reweighting for known biases in the achieved sample are not currently carried out, as the biases have only a small effect on most variables. However, weighting is likely to be introduced from 2002, following the NTS Quality Review – see Chapter 9.

This chapter is structured as follows:

- 5.2 List of the main variables
- 5.3 Area or PSU variables
- 5.4 Household variables
- 5.5 Vehicle variables
- 5.6 Individual variables
- 5.7 Long-distance trip variables
- 5.8 Day variables
- 5.9 Trip variables
- 5.10 Stage variables
- 5.11 County and unitary authority list

The variables are discussed in Sections 3 to 11, grouped by topic within each hierarchical level of the database.

For each variable, the following information is given, if appropriate:

- (i) Sources: for all derived NTS variables, the source variable reference numbers are listed. Note that generally derived variables have high sequence numbers, while original questionnaire data items have lower numbers.

- (ii) Derivation: some variables are carried straight over from the questionnaires; others (the majority) are derived from more than one questionnaire data item. In most cases, the meaning of the variable categories is clear. Where this is not the case, however, some guidance is given on the interpretation made of the data in the derived variable. This includes brief descriptions of data sources for the area or PSU level variables which are based on information external to the survey.
- (iii) Definitions: where technical definitions are implicit in the design of the questions or the coding of the variables, these definitions are explained.
- (iv) Imputation: in order to simplify analysis, missing values have been imputed for many of the variables. In most cases, the proportion of records with missing data was below 2 per cent, and in these cases no details have been given about the imputation. In other cases, the imputation method is described.
- (v) Unbanded variables: some variables are provided both in a banded and unbanded form. The reference numbers of unbanded variables are noted and, where necessary, the units of measurement are also mentioned.

5.2 List of main variables

Data from most variables are also available for earlier years of the continuous database. First available dates are noted below where applicable.

Primary sampling unit (PSU) variables

Area geography

P2	Government Office Region
P5	Type of area
P6	PSU population density
P7	LA population density
P15	County of residence (from 1992)

Concessionary fares schemes

P8	OAP bus scheme
P9	Eligibility for scheme
P10	Type of concession
P11	Membership fee
P12	Times available
P13	Areas available
P14	Modes additional to bus

Household variables

Address

H12	Address type
H51	Length of residence

Access to public transport

H13	Walk time to bus stop
H14	Frequency of bus service
H15	Walk time to railway station
H16	Bus time to railway station
H17	Type of railway station
H106	Main type of bus service (from 1993)

Access to services (from 1998)

H18/19	Walk/bus distance to Doctor
H20/21	Walk/bus distance to nearest Post Office
H22/23	Walk/bus distance to nearest Chemist
H24/25	Walk/bus distance to nearest Food Store
H26/27	Walk/bus distance to nearest Shopping Centre
H28/29	Walk/bus distance to nearest General Hospital

Household composition

H58	Number of people in household
H74	Number of adults
H75	Number of children
H59	Household structure (family)
H60	Household structure
H61	Household structure (NTS)
H62	Disabled (16+) in household

Social and economic

H50	Type of tenancy
H65	HoH/HRP economic status
H66	HoH/HRP employment status
H67	SEG of HoH/HRP
H68	HoH/HRP age/sex
H69	HoH/HRP industry
H70	Household income
H72	Origin of household income
H84i	Real h/hold income equivalent semi-decile (1998/2000)
H85i	Real h/hold income equivalent quintile (1998/2000)
H83	Employed in household
H108	ACORN classification (from 1996)
H121	Index of deprivation (from 1998)

Vehicle access

H35	Number of bicycles
H52	Number of household cars
H53	Number of h/hold motorcycles
H54	Number of h/hold vans/lorries
H55	Number of h/hold cars/light vans
H57	H/hold vehicle availability
H63	Persons with full car licence
H107	Number of household company cars

Period of travel

H7	Travel week end date (month)
H92	Calendar year

Attitudes to local bus services (from 1993)

H100	Local bus service satisfaction
H101	Encouraged to use local buses
H102	1st or only improvement mentioned
H103	2nd improvement mentioned
H104	3rd improvement mentioned
H105	4th improvement mentioned

Vehicle variables**Vehicle characteristics**

V3	Type of vehicle
V15	Taxation class
V85	Vehicle registration
V86/87	Engine capacity
V88	Type of fuel
V130	Make and model (from 1992)
V154	Gender of main driver

Age

V89	Registration letter
V90	Year of first registration
V131	Month of first registration (from 1992)
V91	Vehicle age

Usage

V45/46	Estimate of annual mileage
V92	Rank of car in household
V93/94	Vehicle's total mileage
V95/96	Mileage in travel week
V97/98	Eligible mileage
V121	Ineligible mileage
V139/140	Annual vehicle commuting mileage
V141/142	Annual vehicle business mileage
V143/144	Annual vehicle other mileage

Fuel consumption

V99/100	Fuel purchased (litres)
V101/102	Fuel cost (pounds)
V134/135	Fuel consumed (litres) (from 1992)

Benefits and support for motoring costs

V103	Purchase/hire costs
V112	Company car summary
V133	Person no. company vehicle assigned to (from 1992)

Parking (from 1995)

V145	Overnight parking location
V146	Distance of parking from house
V147	Type of parking payment
V148/149	Annual parking fee

Individual variables**Personal characteristics**

I2	Relationship to HoH/HRP
I3	Sex
I4	Legal marital status
I5/6	Age
I164	Age/sex
I269	Living arrangements

Social and economic

I177	Economic status (from 1998)
I78	SEG of individual
I79	Industry type
I178	Annual income

Travel difficulties

I165	Travel difficulties
I166	Difficulty going out on foot
I167	Walking aids
I168	Difficulty using a bus
I169	Bus difficulty - getting to stop
I170	Bus difficulty - waiting at stop
I171	Bus difficulty - getting on/off
I172	Bus difficulty - to/from seat
I174	Bus difficulty - other/ unspecified
I212	Disabled driver (from 1995)
I214	Years since last drove (from 1995)

Access to motor vehicles

I182	Driving licence
I183	Driving experience
I203	Access to car

Frequency of use of transport (from 1998)

I261	Frequency of bus use
I262	Frequency of express bus/coach use
I263	Frequency of surface rail use
I264	Frequency of taxi/minicab use
I265	Frequency of bicycle use
I266	Frequency of use of air flights within GB

Special tickets and passes

I185	1st ticket/pass type
I186	1st ticket/pass mode priority
I187	1st ticket/pass validity
I188/189	1st ticket/pass use
I205	1st ticket/pass cost

Travel to work

I92	Work place
I220	County of work (from 1992)
I267	Unitary of work (from 1999)
I180	Usual means of travel to work
I251	Type of workplace (from 1998)

Long-distance trip variables (from 1992)*Purpose*

L7	Trip purpose to
L13	Trip purpose from
L12	Trip purpose

Travel distance and main mode

L9/10	Trip length
L8	Main mode of transport

Origin and destination

L5	Trip origin (county)
L6	Trip destination (county)

Travel period

L3	Travel month
L11	Travel week

Day variable

D1	Travel day
----	------------

Trip variables*Structure*

J14	Series of calls
J23	No. of stages (inc. short walks)
J37	Short walk trip

Purpose

J24	Trip purpose from
J26	Trip purpose to
J28	Trip purpose

Travel times

J29/30	Overall travelling time
J32/33	Overall trip time (minutes)
J31/54	Trip start time
J55/56	Trip mid-point time
J59/60	Trip finish time
J52	Day of week

Travel mode and distance

J34	Trip length (inc. short walk)
J36	Main mode of transport

Travel speed

J40	Overall speed
J41	Mean travel speed

Origin and destination (from 1992)

J57	Trip origin (county)
J58	Trip destination (county)

Stage variables*Mode*

S2	Mode of transport
S24	Mode of travel
S28	Short walk
S41	Main stage

Travel time, distance and speed

S25/26	Length of stage
S27	Stage speed
S36/37	Travel time (minutes)

Occupancy

S7-8	Number in party
------	-----------------

Public transport

S15/S38	Number of boardings
S29/30	Ticket cost (1)
S31/32	Ticket cost (2)
S33/34	Total cost (pence)
S35	Type of ticket

Private transport

S18	Private vehicle occupant
S19	Where parked
S21	Parking cost
S22	Whose vehicle?

5.3 Area or PSU variables

These variables describe the 752 postcode sectors (or sector groups) representing the primary sampling units (PSUs) from which the sample of households was selected.

Because the quota months run mid-month to mid-month (see section 3.1) there are some PSUs in the December quota which contain households with travel weeks in December of that year and others with travel weeks in January of the following year. For the calendar period 1998/2000 the breakdown of PSUs is:-
 20 PSUs from December 1997 quota
 240 PSUs from 1998 quota
 240 PSUs from 1999 quota
 252 PSUs from 2000 quota
 giving a total of 752 PSUs.

A value on a PSU variable applies to all households living within that PSU. The PSU level is therefore the highest level at which data of the continuous survey may be analysed, coming above the household level in the analysis hierarchy. Unlike most other variables in the survey, the PSU variables were not derived from information provided by members of the sampled households.

5.3.1 Area geography

P2/ P2g/P2s Regions

Where appropriate, the metropolitan areas and remainders are distinguished within regions. Figure 5.1 (see end of chapter) shows the Government Office Regions (P2g) and the old Standard Statistical regions (P2s) in terms of the old English counties.

P2 Government Office Region

P2		%
1 North East Met	16	2.1
2 North East Non-Met	19	2.5
3 NW & Merseyside Met	53	7.0
4 NW & Merseyside Non-Met	34	4.5
5 Yorkshire & Humberside Met	43	5.7
6 Yorkshire & Humberside Non-Met	22	2.9
7 East Midlands	52	6.9
8 West Midlands Met	36	4.8
9 West Midlands Non-Met	32	4.3
10 Eastern	66	8.8
11 Greater London	111	14.8
12 South East	99	13.2
13 South West	63	8.4
14 Wales	37	4.9
15 Scotland Met	28	3.7
16 Scotland Non-Met	41	5.5
Total	752	100.0

P5 Type of area

This variable is based on the complex definition of urban areas used for analysis of the 1991 Population Census.² In simple terms, an urban area is a continuous built-up area, consisting of a minimum of four 1991 Census Enumeration Districts (EDs), with a minimum population of about 1,000 people. Each NTS PSU postcode sector was then assigned to the correct urban/ rural category according to the type of urban/ rural area which contained the greatest part of the sector's population.

P5		%	
1	Inner London	49	6.5
2	Outer London built up areas	67	8.9
3	West Midlands built up areas	32	4.3
4	Greater Manchester built up areas	27	3.6
5	West Yorkshire built up areas	20	2.7
6	Glasgow built up areas	11	1.5
7	Liverpool built up areas	11	1.5
8	Tyneside built up areas	12	1.6
9	Other urban over 250K	94	12.5
10	Other urban over 100K to 250K	75	10.0
11	Other urban over 50K to 100K	80	10.6
12	Other urban over 25K to 50K	61	8.1
13	Other urban over 10K to 25K (from 1996)	92	12.2
14	Other urban over 3K to 10K (from 1996)	67	8.9
15	Small Urban 3k to 25k (pre-1996)	0	0.0
16	Rural	54	7.2
Total		752	100.0

P6 PSU population density

The very approximate estimate of the number of persons per hectare for the sector is taken from the OPCS sampling frame. The derivation of this estimate used the 1991 Census population count for EDs defined to be within the PSU. An approximate area in hectares for each PSU was derived from the Ordnance Survey grid references of the EDs within the PSU representing north, south, east and west extremities. Land use was ignored.

P6		%
1	Under 1	80 10.6
2	1 to 4.99	101 13.4
3	5 to 9.99	75 10.0
4	10 to 14.99	66 8.8
5	15 to 19.99	58 7.7
6	20 to 24.99	44 5.9
7	25 to 29.99	44 5.9
8	30 to 34.99	50 6.6
9	35 to 39.99	38 5.1
10	40 to 44.99	32 4.3
11	45 to 49.99	37 4.9
12	50 to 59.99	45 6.0
13	60 to 74.99	29 3.9
14	75 and over	53 7.0
Total		752 100.0

P7 LA population density

This estimate of persons per hectare in the local authority containing the sampled sector, is more reliable than the PSU density estimate in P6. However, it relates to a much larger area and is, therefore, less closely matched to the neighbourhoods of the sampled addresses.

P7		%
1	Under 1	67 8.9
2	1 to 1.99	74 9.8
3	2 to 3.49	69 9.2
4	3.50 to 4.99	50 6.6
5	5 to 9.99	109 14.5
6	10 to 14.99	64 8.5
7	15 to 19.99	47 6.3
8	20 to 24.99	50 6.6
9	25 to 34.99	68 9.0
10	35 to 44.99	89 11.8
11	45 and over	65 8.6
Total		752 100.0

P15 County of residence

See section 11 below for a listing of the counties used.

5.3.2 Concessionary fares schemes

A survey of local authorities was carried out by the Department of Transport in 1997³ to determine the concessionary fares arrangements available to persons of pensionable age throughout Great Britain. The results were used to create variables P8 to P14 for each sampled PSU.

P8 OAP bus scheme

If a concessionary bus fares scheme for the elderly is not available in the administrative area which includes the PSU the remaining variables P9-14 are coded 'DNA'.

P8		%
1	Yes	737 98.0
2	No	15 2.0
Total		752 100.0

P9 Eligibility for scheme

The characteristics defining eligibility for the concessionary fares scheme relate to the elderly or retired:

- pensionable age: 60 for women, 65 for men.
- income restrictions include being in receipt of either housing or supplementary benefit or having earnings below a stated level.
- other conditions include restrictions on hours worked and on spouse's age.

P9		%
1	Pensionable age	647 87.8
2	Man 65+ / Woman 65+	4 0.5
3	Pensionable age & pension received	51 6.9
4	Pensionable age & income restriction	28 3.8
5	Other condition	7 0.9
Total		737 100.0
6	NA	0
7	DNA	15
Grand Total		752

P10 Type of concession

In a number of cases, the concession varies for different types of people within the overall qualifying group. The category 'other reduced fare' includes schemes offering varying levels of fare reduction, as well as reductions not specified in other categories.

P10			%
1	Free fare	182	24.7
2	Flat fare	117	15.9
3	1/2 fare	237	32.2
4	2/3 fare	24	3.3
5	Other reduced fare	18	2.4
6	Tokens: up to £15	18	2.4
7	Tokens: £15.01 to £30	18	2.4
8	Tokens: over £30	13	1.8
9	Tokens: value unspecified/variable	0	0.0
10	Mixture of fares & tokens	86	11.7
11	Other type	24	3.3
Total		737	100.0
12	NA	0	
13	DNA	15	
Grand Total		752	

P11 Membership fee

P11			%
1	Nil	432	58.6
2	Up to £5	147	19.9
3	£5.01 to £10	98	13.3
4	£10.01 to £15	21	2.8
5	£15.01 to £25	39	5.3
6	£25.01 to £40	0	0.0
7	Over £40	0	0.0
8	Other fee	0	0.0
Total		737	100.0
9	NA	0	
10	DNA	15	
Grand Total		752	

P12 Times available

Peak hours are defined as 6.30-9.00 a.m. and 4.00-6.30 p.m. on Monday to Friday. Schemes which exclude travel in the morning peak period but permit travel throughout the afternoon and evening are coded as a mixture of peak, off-peak.

P12			%
1	Anytime	352	47.8
2	Peak hours only	0	0.0
3	Off-peak only	30	4.1
4	Mixture of peak, off peak	327	44.4
5	Other time restrictions	28	3.8
Total		737	100.0

P13 Areas available

This defines the area of travel over which the scheme applies. The area is also likely to define residential

qualifications in the great majority of cases. District-wide schemes include parish council schemes which applied in the area administered by the district council. Category 2 includes cases where adjacent districts combine to provide a scheme that does not operate throughout the county.

P13			%
1	District only or less	114	15.5
2	Above District, not Countywide	36	4.9
3	Countywide	476	64.6
4	Above County	111	15.1
5	Other area restriction	0	0.0
Total		737	100.0
6	NA	0	
7	DNA	15	
Grand Total		752	

P14 Modes additional to bus

Some bus schemes permit members' concessionary travel on other modes. Private/voluntary services include independently operated services such as social car schemes, and a variety of forms of community transport such as dial-a-ride.

P14			%
1	None	172	23.4
2	Public services only	145	19.7
3	Private / voluntary services only	58	7.9
4	Both private/vol. & public	360	49.0

5.4 Household variables

General information about each of 9,390 households was collected at the initial interview from the head of household, spouse or, in exceptional circumstances, from another responsible adult, using the household questionnaire. Additional household variables were derived from information collected on the individual and vehicle questionnaires.

A household consists of one or more people who have the sampled address as their main residence and either share at least one main meal a day or share the living or sitting room. (This is the same definition as used in the 1985/86 NTS but note that in earlier NTSs there was a more restrictive definition of a household. For instance, in the 1978/79 survey people who shared the living accommodation would not have been treated as members of the same household unless they also

shared common stocks of basic foods). Where people have more than one address, they are included if the sampled address is their stated main residence.

However, over-riding criteria for inclusion or exclusion are that: adult children who come home only for holidays are excluded; a household member (such as a sailor) away continuously for 6 months is excluded; anyone continuously in residence (such as an au-pair) for 6 months or more is included; and second homes are not counted as main residences.

5.4.1 Head of household and household reference person

The Household Reference Person (HRP) definition was introduced to update the Head of Household (HoH) definition used in most social surveys. The HoH definition is inherently sexist in that it selects men rather than women in most circumstances where a choice has to be made. The National Travel Survey adopted the HRP definition in 2000.

The HoH is defined as:

- in a household consisting of husband, wife (or cohabiting couple) and children all aged under 16, is defined as the husband (or male cohabitee).
- in other households the HoH is the person in whose name the accommodation is owned or rented.
- if the accommodation is in the joint names of persons of the same sex the eldest is HoH; and when they are of different sex the male is HoH

The new HRP definition is defined as:

- in households with a sole householder, that person is the household reference person
- in households with joint householders, the person with the highest income is the household reference person
- if two or more householders have exactly the same income, the older is the household reference person

5.4.2 Address

H12 Address type

(Harmonised from 2000)

This describes the residential unit occupied by the household. A household living in a converted flat in a semi-detached house would be counted as living in the flat, not the house, as the former is their residential unit. A flat is generally distinguished from rooms by having all its rooms contained behind one front door.

H12 (1998 methodology)		%
1 Detached	1,359	22.4
2 Semi-detached	2,086	34.3
3 Terrace/ end terrace	1,597	26.3

8 Always lived here	2,389	25.4
Grand Total	9,390	100.0

5.4.3 Access to public transport

H13-17 and H106 describe the neighbourhood in terms of the available public transport. Note that it is the nearest bus stop/station, not necessarily the one normally used. The variables were treated as measures of fact, not of opinion, which means that it was open to interviewers to make use of information other than that offered by the household if this gave a better indication of the true position.

H13 Walk time to bus stop

H13		%
1	3 mins. or less	5,278 56.2
2	4-6 mins.	2,870 30.6
3	7-13 mins.	911 9.7

5.4.5 Household composition

All members of each household were required to complete a diary. The size of household is, therefore, equivalent to the number of responding individuals in the sample. The rules which determine the inclusion of an individual as the member of a sampled household are set out in McCrossan (1991).⁴

In household variables, a child is defined to be aged 0 to 15, an adult to be aged 16 and over. Adult children refer to children of the HoH/HRP aged 16 and over.

H62 Disabled (16+) in household

Derived from I2, I5 and I165. The term 'disabled' is used to describe a person who has difficulty, for reasons of long-standing poor health or physical disability, in using buses or cars or in going out of the house on foot.

Under 16s were not asked these questions and are therefore not included in this classification.

H62 (1998 methodology)		%
1	Hoh only	1,015 16.7

Total		9,390 100.0

H65–69 HoH/HRP variables

In these variables, the household is classified according to the characteristics or circumstances of the HoH/HRP. H65 (HoH/HRP working status) is derived from I177. Unemployed combines waiting for and looking for a job.

H65 HoH/HRP working status

H65		%
1 Full time	4,860	51.8
2 Part time	651	6.9
3 Unemployed	156	1.7
4 Retired/ Perm.sick	3,097	33.0
5 Student	81	0.9
6 Looking after home/ family	428	4.6
7 Other non- working	117	1.2
Total	9,390	100.0

H66 HoH/HRP employment status

Derived from I78 and I80. If I78 is coded 2, 4 or 16, employees are defined as managers; otherwise they are defined as other employees.

H66		%
1 Self employed	1,107	11.8
2 Employed manager	1,530	16.3
3 Other employee	6,485	69.1
4 Never worked	268	2.9
Total	9,390	100.0

H67 SEG of HoH/HRP

Derived from I78. (Does not apply (DNA) if the HoH/HRP had never worked).

H67		%
1 Employer: large	7	0.1
2 Manager: large	963	10.6
3 Employer: small	209	2.3
4 Manager: small	578	6.3

H70/72/84i/85i Household income

When the household contains only one adult, that person's individual income is the same as that of the household. When the household contains more than one adult, the income of the whole household is an estimate obtained from one member only – either HoH/HRP or HoH/HRP's spouse.

Where information was either refused or not available for some other reason, values were 'patched' by summing the individual incomes of the household members, the best estimate being the midpoint of the income band. When the individual incomes required for this process were missing they were first patched, by imputation from comparable cases for which income had been reported (see I178).

H70 Household income

To reflect the rise in incomes, the bands used by the interviewers to identify income were revised from the start of 1995.

H70		%
1	Less than £1,000	61 0.6

H84i and H85i Real h/hold income equivalent level

The real household income equivalent (H86) is obtained by using household income equivalent scales to assign values to adults and children within a household and then dividing income by the sum of these values so that the household income relative to a household consisting of just one married couple can be obtained. These values are then deflated using the Tax and Price Index (TPI) and standardised so that the average value for households in 1990 was 100.0.

The values assigned to individuals within a household are derived from work done by the Department of Social Security. More details are given in Appendix A of *Focus on Personal Travel*.⁵

H84i Real h/hold income equivalent (semi-decile)

Households are assigned to one of twenty groups, each containing about 470 households, in ascending order of affluence. Households in income bands straddling two or more code bands are randomly allocated to one of the bands in the appropriate proportions.

H85i Real h/hold income equivalent quintile

H85i is derived from H84i.

H85i		%
1	Lowest real income	1,878 20.0

H121 Index of Multiple Deprivation (from 1998)

The index is based on the premise that multiple deprivation is made up of separate dimensions or 'domains' of deprivation. These domains reflect different aspects of deprivation. Six domain indices (income, employment, health deprivation and disability, education skills and training, housing and geographical access to services) are combined to make the overall Index of Multiple Deprivation. The IMD classification is only available for England.

H121		%
1 (most deprived)	1,090	13.8

Grand Total		9,390

5.5 Vehicle variables

Details were collected about motor vehicles available for personal use by any member of the household during the travel period. These household vehicles include vehicles temporarily out of action but exclude any vehicle on loan to anyone outside the household for the period. Hired, leased or borrowed vehicles are included if available for the full period. Company cars, provided to employees for their own use as well as for firm purposes, are included, but company 'pool' cars, that is firm-owned cars not available for the sole use of one employee, are excluded.

The availability of a motor vehicle or vehicles was recorded at the first interview, on the household questionnaire, where the type of vehicle and the members of the household with access to the vehicle were also recorded. The main driver was asked to give details on the vehicle questionnaire both at the first interview and at the second (mileage and fuel information for travel week).

Although interviewers asked to see registration documents, these were used only for about one vehicle in five to record relevant details, including taxation class, engine capacity, age and registration year letter.

Ten electrically-operated vehicles were recorded, but the information collected about these vehicles was limited to type of vehicle, type of fuel, availability, main driver and person with daytime access, other variables being coded DNA.

The data listed below covers just primary vehicles, i.e. those believed to be available to the household at the start of the travel week. Vehicles acquired after this are treated as secondary vehicles and the data for these vehicles is kept separately and only used to analyse trip stages by household vehicles during the travel week. A full description of this refinement to the vehicle database was given in Appendix B of the 1991/93 NTS report.⁷

5.5.1 Vehicle characteristics

V3 Type of vehicle

From the household questionnaire. Four-wheeled cars include light vans (unladen weight not more than 1.5 tons) with rear side windows, Range Rovers, and 'people carriers'.

V3		%
1	4 wheel car	9,146 90.5
2	3 wheel car	5 0.0
3	Invalid car	3 0.0
4	M'cycle/Scooter with side car	15 0.1
5	M'cycle/Scooter	265 2.6
6	Moped	21 0.2
7	L'rover, Jeep	254 2.5
8	Light Van	335 3.3
9	Other Van / Lorry	15 0.1

9	DNA	17
Grand Total		10,110

V85 Vehicle registration

This records the relationship of the registered keeper of the vehicle to the household. A distinction is made between firm-registered vehicles where the firm employs a household member, vehicles hired, by an employer for an employee's use, cars hired by a household member and other firm-registered vehicles, hired or otherwise (for which no details coded). Hire includes hire and leasing.

If registration details were unknown, the question asked was who 'owns' the vehicle.

V85		%
1	Employer	616 6.1
2	Other firm - employer hired	75 0.7
3	Own business	51 0.5
4	Other firm - own business hired	1 0.0

5.5.3 Usage

V45–46 Estimate of annual mileage

This is the main driver's estimate of the vehicle's total mileage in a year, including ineligible mileage. It is not collected for vehicles borrowed or hired for less than 12 months.

The unbanded estimates are held in V45.

V46		%
1 Under 500	72	0.7
2 500-999	109	1.1
3 1,000-1,999	382	3.8

9 DNA	498	
Grand Total	10,110	

V93–94 Vehicle's total mileage

The estimate of total mileage is based on the milometer reading at the end of the travel week (or at the beginning if the end-week reading was not available), adjusted if the milometer was on the second cycle.

Since no other variable gives a reliable guide to total mileage, this variable was not patched when data were not available.

Unbanded values are in V93.

V94		%
1 Up to 2,000 miles	289	3.2
2 2,001- 4,000 miles	202	2.3
3 4,001- 6,000 miles	193	2.2

16 NA	1,203	
17 DNA	10	
Grand Total	10,110	

V95–96 Mileage in travel week

The main driver recorded on a fuel and mileage sheet the milometer readings at the start and end of the travel week. The interviewer transferred these figures to the vehicle questionnaire and calculated the mileage during the week. Missing data for patched values were taken from eligible mileage (V97) except for vans, lorries, minibuses and similar vehicles, which were not patched.

Unbanded values are in V95.

V96		%
1 None	945	9.5
2 1- 9 miles	229	2.3
3 10- 29 miles	687	6.9
4 30- 49 miles	859	8.6

15 DNA	60	
Grand Total	10,110	

V121 Ineligible mileage

Ineligible mileage may be mileage driven by someone outside the household, driven to carry goods in course of work, driven off the public road, driven outside GB, or driven as a taxi or hire car. Values were missing for nearly 14 per cent of vehicles. Most vehicles were patched to category 1 (no ineligible mileage), the most likely value. The exceptions were vans, lorries, minibuses and similar vehicles which were not patched.

The unbanded values may be derived from V95 and V97.

V121		%

5.5.4 Fuel consumption

V99–100 Fuel purchased (litres)

The amount of fuel put in the tank during the travel week was recorded by the main driver on a fuel and mileage sheet and noted at the second interview (except for the electric vehicles). It was recorded in

whole litres, or gallons to the nearest tenth. If only the cost was provided, interviewers estimated the amount of fuel using available evidence on fuel prices. The amount of fuel recorded may be greater than that implied by the cost (V101) because some or all of it could have been provided free of charge.

Unbanded values are in V99 .

V100		%
1 None	4,536	45.1
2 1- 15 litres	1,009	10.0
3 Over 15- 30 litres	1,834	18.2
4 Over 30- 60 litres	2,064	20.5
5 Over 60- 120 litres	505	5.0
6 Over 120 litres	102	1.0
Total	10,050	100.0
7 NA	0	
8 DNA	60	
Grand Total	10,110	

V101/102 Fuel cost (pounds)

The cost of fuel put in the tank was recorded to the nearest £. This is the cost to the household only, and may understate the full cost since for some vehicles some or all fuel was provided free of charge. For individual vehicles, the unit will be inaccurate because of rounding in both source variables.

Unbanded values are in V101.

V102		%
1 None	4,732	47.1
2 £1 to £7	244	2.4
3 Over £7 to £15	1,495	14.9
4 Over £15 to £25	1,644	16.4
5 Over £25 to £55	1,629	16.2
6 Over £55	306	3.0
Total	10,050	100.0
7 NA	0	
8 DNA	60	
Grand Total	10,110	

V134/135 Fuel consumed (litres)

Questions are asked to ascertain the size of a vehicle's fuel tank and also to obtain fuel gauge readings at the start and at the end of the travel week. These readings are noted down on the fuel and mileage chart. The answers to these questions are combined with the fuel purchased during the travel week to estimate fuel consumption.

Unbanded values are in V135 .

V134		%
1 None	1,044	10.4
2 1 - 15 litres	3,764	37.5
3 Over 15 - 30 litres	2,613	26.0
4 Over 30 - 60 litres	1,852	18.4
5 Over 60 - 120 litres	640	6.4
6 Over 120 litres	129	1.3
Total	10,042	100.0
7 NA	5	
8 DNA	63	
Grand Total	10,110	

5.5.5 Benefits and support for motoring costs

A series of questions were used to discover the types of financial support (if any) received from household members' employers, or other firms or organisations, towards motoring costs. Neither the full cost of motoring, nor the support received, was quantified, though the distinction between full and partial payment was made for some types of support. In general, firm means a firm employing someone in the household, but not necessarily the main driver of the vehicle. Support is, in some cases, assumed for vehicles with a firm as registered keeper.

V103 Purchase/hire costs

Firm-paid includes the payment of any proportion of the purchase price. Firm-registered and firm-hired/ leased vehicles are assumed to be paid for by the firm. No information was collected for borrowed vehicles or vehicles registered to an organisation other than an employer or hire/lease firm; in these cases (code 4) it is unlikely that the household paid the purchase/hire costs.

V103		%
1 Firm paid (firm reg/hire)	691	6.8
2 Own business	52	0.5
3 Firm paid (private reg/hire)	133	1.3
4 Not firm paid (private reg/hire)	9,145	90.6
5 No inf. (prob. no cost to household)	75	0.7
Total	10,096	100.0
6 NA	0	
7 DNA	14	
Grand Total	10,110	

V112 Company car summary

A company car is a 4-wheeled car for which a firm pays part or all of the purchase cost, the main driver is not self-employed and the car is either in the firm's name or registered privately with the individual paying extra income tax. This differs from the DVLA definition which simply includes all cars registered to a company. The free fuel referred to in categories 1

and 2 relates to any fuel knowingly paid by the employer for private mileage done in the vehicle. Category 3 includes those cars for which the main driver is self-employed and income tax relief is claimed on the vehicle. Category 4 contains cars for which the employer makes some contribution to either the running costs or fuel costs for private mileage. Category 5 distinguishes cars which are used for work and the employer only makes a contribution towards the fuel costs incurred in the course of work and not any private running costs. Category 6 includes those which are used for business purposes but for which no allowance is received from the employer.

Categories 7 and 8 contain cars which receive no support from the employer, or business if the main driver is self employed.

V112		%

5.6 Individual variables

Fully-responding households on the 1998/2000 database contain 21,868 individuals of all ages. Demographic information about individuals was collected on the household questionnaire; the rest of the information about them was obtained on the individual questionnaire. Proxy information was accepted under certain circumstances, particularly if the person concerned was either aged under 11 or unable to provide the information themselves (e.g. because of mental illness or because they were away from home throughout the interview period).

A number of individual variables apply only to particular subgroups:

- travel difficulties caused by disability (aged 16 and over)
- driving licences, employment, income, trips to work (aged 16 and over)
- special passes/tickets (holders of these tickets).

5.6.1 Personal characteristics

I2 Relationship to HoH

(Harmonised from 2000)

From the household questionnaire. The definition of the Head of Household (HoH) and Household Reference Person (HRP) are given in the introduction to the household variables.

5.6.2 Social and economic

I177 Economic status

(Harmonised from 1998)

Applying to all persons aged 16 and over, this is the person's working status in the previous week. Student means full-time student at school or college. Home or family indicates housewives (and other household members) not in paid employment but looking after the home.

I177		%

I78 SEG of individual

Applying to all who had ever been in paid employment. The standard Socio-Economic Group (SEG) classification is used in population censuses and on most government household surveys. Information about the person's occupation, employment status (as manager, foreman/ supervisor, ordinary employee, or self-employed) and, for managers and the self-employed, the number of employees in the work establishment, is combined to define the SEG category for each individual (see OPCS, 1990).⁸

I178 Annual income

Applying to all persons aged 16 and over. Respondents were asked about their sources of income and then for gross income from all sources before deduction of tax and national insurance. The information was requested only as a weekly or annual coded figure, selected from a show card. However, as in the past, income appears to be under-estimated.

In some cases, the answer was either not answered or was explicitly refused. In some of these cases income is estimated by subtraction of the income of other household members from that of the whole household (H70). In the others it is imputed from the nearest record, matching on age, sex, working status, SEG and relationship to HoH/HRP, with income known. By taking the nearest record of the sorted file the imputation is also by implication matching on region of residence and type of area.

To reflect the rise in incomes, the bands used by interviewers to identify income were revised from the start of 1995.

5.6.3 Travel difficulties

The questions focus on difficulties in undertaking three travel activities – going out on foot, using buses, and getting in and out of a car. The variables identify people with mobility problems and give some indication of the degree of difficulty. Elderly people who felt that old age was the cause of their difficulty are included.

The section applies only to individuals aged 16 and over.

I165 Travel difficulties

If any of the initial questions identifying travel difficulty were not answered, the editing procedure checked whether or not any subsequent variables dependent on that variable had been coded, and a value was imputed for I165: If no subsequent related variable was coded, then the difficulty was assumed not to exist for that individual. The consequence of this editing action may be a slight under-estimation of the number of people with travel difficulties.

I165		%

I167 Walking aids

The questions on which this variable was based asked about 'aids to walking or movement used when you go out on foot'. It was addressed to people who either said that they went out on foot or that they did not but could. They were asked about each of the aids in turn.

However, so that each person would be assigned to one category only, the aids were listed in descending order of the degree of severity of disability which they imply, and the person was coded to the first aid in this list that he or she used (e.g. a person who used crutches and callipers was coded to crutches since crutches came above callipers on the list). Walking frame includes tripod. Crutches include the use of one crutch. Other aids include a white stick for the blind and a shopping trolley used as an aid.

I203 Access to car

Car means ordinary cars, jeeps, Land Rovers, light vans, minibuses and dormobiles. The main driver of a vehicle is the person who drives the most mileage in the car. In the case of company cars, this may not be the same person to whom the car has been assigned. A driver is the holder of a full licence valid for at least

one household car. Some main drivers may be the main drivers of more than one household car.

I203		%

5.6.6 Special tickets and passes

The variables in this section occur in three groups of six – one group for each ticket or pass held by the individual up to a maximum of three.

Only the first ticket details are given in variables I185 to I205 below. 325 individuals had second tickets (variables I191 to I196) and 11 individuals had a third ticket (variables I197 to I202).

I185 1st ticket/pass type

Derived from I105. Non-concessionary tickets and passes (codes 1–5) refer to schemes devised by operators for commercial reasons and offering reduced travel costs.

A season ticket is valid for trips within a specified period on one specified route. An area travel card is valid for travel within a specified period on any route within a specified area. A combined season/area travel card functions as a season ticket at one end of the route and as an area travel card at the other. Railcard includes Student Travel Card.

I185		%
1	Season ticket	346 9.1
2	Area travel card	408 10.7

Total	3,811	100.0
13 NA	0	
14 DNA	18,057	
Grand Total	21,868	

I186 1st ticket/pass mode priority

This gives the modes for which the ticket/pass is valid, listing first the mode used for the most mileage.

Missing information for this variable was due mainly to a failure to specify main mode when the ticket was valid for a mixture of modes. The imputed category for such tickets was found by first examining the stage records to identify the mode by which the longest distance was travelled using the ticket. If this was not well-defined, the value taken was that found in the nearest similar record with the same code on I106 and I186 completed. Where no modes were specified for the ticket, the imputed category was assigned by inspection.

I186		%

I205 1st ticket/pass weekly cost

Not applicable to subsidised travel tokens (code 11 in I185) and a number of unspecified tickets (in code 12) which cover a specific number of trips rather than a specific time period. The weekly cost of the ticket is calculated by dividing the total cost to the respondent by the number of weeks in the period of validity. A zero cost is coded for tickets valid for over a year or for an unlimited period.

For scholars' tickets, the weekly cost is the cost of three terms spread over 52 weeks.

The imputation distinguished three categories of ticket on the non-imputed value of I190. Tickets free to the respondent were coded as nil weekly cost; other missing values were either coded to category 2 (most likely value for I190=5-7) or they were patched from the nearest similar record of the same ticket type.

5.6.7 Travel to work

I92 Work place

Applying to individuals who had been in paid employment in the previous week. A person's work place was defined as the place visited for work on at least two consecutive work days in a week or on at least one day in four consecutive weeks. If this definition produced two (or more) candidates for the work place, preference was given to the place visited most often or, if they were visited equally often, the one furthest away.

The definition of work place is linked to the classification of trips to and from work. Only people with a regular place of work away from their home, as defined by the first two categories of this variable, may classify trips to or from that place as work trips. All other work-related trips must be classified as in course of work.

5.9 Trip variables

5.9.1 Structure

The database contains details of 357,547 trips for the 1998/2000 period.

J14 Series of calls

A trip is classified as a series of calls at the discretion of the interviewer. It refers to in course of work or shopping travel which is interrupted by many stops and is too difficult for the respondent and interviewer to subdivide reliably into a series of separate trips. Series of calls have the same purpose to and from, but not all such trips are necessarily classified as series of calls. For strict comparability with earlier surveys, series of calls are excluded from trip or stage counts (but not from analyses of distance travelled).

J14		%
1	Yes	1,101 0.3
2	No	356,446 99.7
Total		357,547 100.0

J23 Number of stages including short walks

On days 1 to 6, the number of stages excludes short walk stages which were not recorded.

J23		%
1	One	346,259 96.8
2	Two	7,999 2.2
3	Three	2,835 0.8
4	Four	377 0.1
5	Five	68 0.0
6	Six	8 0.0
7	Seven or more	1 0.0
Total		357,547 100.0

J37 Short walk trip

Short-walk trips now include all trips where the main mode was a short walk stage of less than 1 mile. It therefore includes a few multi-stage walk trips with an overall length of over 1 mile.

J37		%
1	Yes	12,742 3.6
2	No	344,805 96.4
Total		357,547 100.0

5.9.2 Purpose

A trip is defined by both purpose from variables and purpose to variables. The overall purpose of a trip is defined by what the person did at the end (unless it was to return home or occasionally to return to usual place of work, in which case it was the activity from which they were returning). Trip purpose describes an activity rather than the nature of the place in which it takes place.

Work is confined to trips to a place defined as the person's usual work place (see I92). If there is no such place, all travel to work is classified as in course of work.

In course of work applies to trips made for the purpose of moving to places of work other than a regular work place (as defined by I92). It excludes work-related travel mainly for the carriage of goods, or the movement or delivery of the vehicle used (if relevant) which is not eligible for inclusion in the survey.

Education applies to trips made by school children or students to their schools or colleges.

Shopping includes window-shopping as well as buying trips. In 1998 the shopping category was split to differentiate between food/grocery shopping and

other types of shopping. Since people may often buy their food shopping on the same trip as they purchase other items, trips are categorised by the main shopping reason for the trip. Services such as opticians or hairdressers are excluded, being covered by personal business.

Personal business – medical this applies to trips made by the person to obtain medical consultation or treatment for himself from doctor, dentist, hospital, optician, chiropodist, etc. If the purpose is the medical care of other people, the purpose is coded as personal business - other.

Personal business – other includes visits to services such as a bank, dry-cleaners, estate agent, playgroup, day centre for the elderly, or church.

Eat/drink applies only if the main purpose of the trip is to eat or drink at the destination. If the main purpose is to take food or drink away or to socialise or to be entertained, then other codes would be appropriate.

Visit friends includes visiting relatives. This only applies if the visit is to the residence of the friend or relative. If the visit exceeds three nights, holiday base applies.

Other social covers visits to socialise with friends/relatives away from their residence.

Entertainment/public activity includes visits to cinemas, political meetings, evening classes, football matches, to play indoor games like snooker, etc. Sport: participate covers all outdoor sports, also vigorous indoor sports such as badminton, swimming, judo. However, trips to play darts, snooker and table tennis, as well as all trips to watch sport, are treated as entertainment.

Holiday base applies to a stay of at least one night in a hotel, caravan, holiday cottage, and so on, for leisure or recreational purposes. It also refers to stays with friends or relatives of four nights or more.

Day trip/just walk refers to trips made for pleasure purposes within a single day for which other categories are not appropriate. Examples include taking the dog for a walk, jogging, a sight-seeing trip, or a spin on a bike.

Other includes learning to drive.

Sometimes the trip purpose is simply to escort someone else (for instance, a parent taking a child to school) or to accompany them (a child with its mother on a trip to the shops). The purpose of the person

being escorted determines which ‘escort’ category applies. For instance if a mother takes a child to school, the trip purpose for the child is education and for the mother it is escort-education. Escort home includes escorting a non-household member to their own home.

In variables J24 and J26, category 21 ‘Home’ refers specifically to the address at which the respondent was living at the time of the initial interview – i.e. the address that was selected for the NTS. ‘Home’ is the respondent’s home – not someone else’s home.

J28 Trip purpose

The overall purpose is defined by the person’s own purpose to, unless this is home (i.e. the sampled address), in which case it is defined by purpose from, or work for which special categories apply, or eat/drink and day trip/just walk which have been modified. There are five special categories related to employment-related travel. Commuting includes trips from home to work and vice versa. Business trips includes all trips to in course or work and trips from in course of work back to work, home or escort home. Other work trips are all other trips to work and work to escort home. These few trips are often amalgamated with other personal business trips since they often involve returning to work after a visit to the shops, etc. Escort commuting and escort business and other work trips are the escort equivalents of the three categories described above. Because a trip is always one-way it can never be both from and to home.

Eat/drink trips from work, personal business or escort to eat/drink are included with ‘personal business other’. The majority of the remainder (social, leisure and home trips to eat/drink, and all trips home from eat/drink) were allocated to the category eat/drink with friends.

5.9.3 Travel times

Travel time is the time actually spent on the mode of transport; trip time is the total time between the beginning and end of the trip including any waiting time and ineligible travel such as short walk stages on days 1 to 6 of the travel week.

J29/30 Overall travelling time

This is the accumulated travel time in minutes over all stages in the trip. On days 1 to 6 the times of short walk stages were not recorded.

Unbanded values are in J29.

J30		%

Total	357,547	100.0

J32–33 Overall trip time

This is the time in minutes between the start time and end time. It includes waiting time as well as ineligible travel (short walks on days 1–6, off the public highway, etc.).

Unbanded values are in J32.

J33		%
1 less than 3 mins	3,825	1.1
2 3 under 8 mins	64,289	18.0
3 8 under 15 mins	75,889	21.2
4 15 under 30 mins	120,451	33.7
5 30 under 45 mins	51,383	14.4
6 45 mins under 1 hour	16,618	4.6

7 1 under 1.5 hours	14,463	4.0
8 1.5 under 2 hours	4,666	1.3
9 2 under 2.5 hours	2,320	0.6
10 2.5 under 3 hours	1,034	0.3
11 3 under 4 hours	1,152	0.3
12 4 under 5 hours	588	0.2
13 5 under 6 hours	361	0.1
14 6 hours and over	508	0.1
Total	357,547	100.0

J31/J54 Trip start time

The time of day when the trip started is banded:

- in hours from 0000 to 0559;
- in half hours from 0600 to 0659, 0930 to 1629, and 1830 to 2359;
- in quarter hours from 0700 to 0929 and 1630 to 1829.

Unbanded values (J54) are in minutes from midnight.

J55/56 Trip mid-point time

This variable represents the time of day when half the trip time has elapsed, and is banded as J31.

Unbanded values (J55) are in minutes from midnight.

J59/60 Trip finish time

This new variable represents the time of day when trip finished, and is banded as J31.

Unbanded values are in J59 in minutes.

J52 Day of week

J52		%
1 Monday	50,722	14.2
2 Tuesday	53,130	14.9
3 Wednesday	53,357	14.9
4 Thursday	53,797	15.0
5 Friday	55,487	15.5
6 Saturday	51,274	14.3
7 Sunday	39,780	11.1
Total	357,547	100.0

5.9.4 Travel mode and distance

J34 Trip length (inc. short walk)

Derived from S25. This is the accumulated distance over all stages in the trip. For trips on days 1 to 6, trip distance may be understated because short walks were not recorded.

J34		%
1 Under 1 mile	34,477	9.6
2 1 to under 2 miles	76,295	21.3
3 2 to under 3 miles	50,093	14.0
4 3 to under 5 miles	62,324	17.4
5 5 to under 10 miles	64,898	18.2
6 10 to under 15 miles	26,838	7.5
7 15 to under 25 miles	21,294	6.0
8 25 to under 35 miles	7,635	2.1
9 35 to under 50 miles	5,594	1.6
10 50 to under 100 miles	5,246	1.5
11 100 to under 200 miles	2,152	0.6
12 200 miles and over	701	0.2
Total	357,547	100.0

J36 Main mode of transport

Derived from S24–26 and S28. This refers to the mode for the longest stage in the trip. For a single-stage trip the main mode of transport and stage mode of transport are equivalent, but with walks divided into long and short. For a multi-stage trip, the main stage is defined as the longest in distance of all the stages in the trip; if the longest stage distance applies to two or more stages the last occurring is taken as the main stage.

J36		%

5.9.5 Travel speed

J40 Overall speed

Derived from J33, S25–26 and S28. Not applicable to short walks. The sum of the stage lengths (including those imputed for S25–26) of all stages known not to be short walks, divided by the overall trip time (J33) and expressed in miles per hour.

J40		%
1 Under 5mph	44,428	12.9
2 5 under 7.5 mph	29,750	8.6

5.9.6 Origin and destination

Trip origin and destination are collected at county level, using the listing in section 11 below.¹⁰

J57 Trip origin

J58 Trip destination

5.10 Stage variables

Trips comprise one or more consecutive stages. The 1998/2000 database contains details of 372,665 stages. The start and end of a stage is defined by a change of mode of transport or by a change of vehicle which required a change of ticket. Where more than one vehicle of the same type is used successively and no change of ticket is required, one continuous stage is counted but the change of vehicle is recorded in the number of boardings during the stage.

5.10.1 Mode

S2 Mode of transport

Walk includes only walking which is eligible for inclusion in the survey. On days 1–6, walks of less than one mile were not recorded. On day 7, walks of between 50 yards and a mile were recorded. Children's play in the streets was excluded but rides in prams, pushchairs and on toy bicycles are recorded as walk so long as they were on the public highway and satisfied the distance criteria above.

Bicycle covers the use of all forms of non-motorised bicycle and tricycle, other than circumstances described under walk above.

Private (hire) bus includes a bus (or minibus) which, for the trip concerned, is provided for use by a specific group of people and not for use by the general public. The use of works and school buses is generally included here though in some cases, where a normal stage service is also offered, a respondent may correctly regard them as an ordinary stage bus service (in which case one of the bus categories would be appropriate).

Car includes conventional 3 or 4-wheeled cars but excludes other body types (see below). Hire cars are included unless a driver is provided, in which case they are coded as taxis.

Motorcycle, scooter, moped comprises all two-wheeled motor vehicles.

Van/lorry refers to vans (motor vehicles with three or four wheels and with no side windows to the rear of the driver's seat), lorries, Landrovers and jeeps.

Other private includes dormobiles, motorised caravans, invalid carriages and private air travel.

London stage bus and other stage bus comprise buses operating on stage services and available to the general public for short-distance travel. Fast services to suburban areas, sometimes marketed as 'express' routes are generally included here. London buses include all local buses in London whether or not they are being run by London Transport. The express services to Heathrow fall into the coach/express bus category. Stage services in other parts of the country comprise other stage buses.

Coach/express bus includes regular services, available to the general public, designed for long-distance travel with few or no intermediate stops.

Excursion/tour bus refers to coach or bus excursions and tours by fare-paying members of the general public.

LT Underground is confined to train services operated by London Transport.

Surface rail consists of all train services, including the Waterloo-City and the Merseyside underground system, formerly operated by British Rail.

Air includes all domestic public air travel where the trip begins and ends within the area covered by the survey.

Taxi/minicab includes minicabs and other hire cars where a driver is provided.

Other public transport includes Glasgow underground, the Tyne and Wear Metro, the Docklands Light Railway, other light rail and tram routes and privately-run trains that provided a regular public service (round trips on private railways by enthusiasts do not qualify for inclusion in the survey).

2 Other stage	15,118	4.1
Total	372,665	100.0

5.10.2 Travel time, distance and speed

S25/26 Length of stage

Applicable to all stages. Distance is understated because short walk stages were not recorded on days 1 to 6.

Unbanded values are in S25, held in units of one-tenth of a mile. A derived variable SD is generally used for estimating distance as it reweights short walk stages to compensate for those not recorded on days 1 to 6 of the travel week.

S26		%
1 Under 1 mile	40,103	10.8
2 1 to under 2 miles	80,597	21.6
3 2 to under 3 miles	52,053	14.0

14	6 hours and over	326 0.1
Total		372,665 100.0

5.10.3 Occupancy

S7/8 Number in party

A party is a group of people who decide to travel together, set out together and stay together for at least half the distance of the stage. For travel in private vehicles, the party comprises people using the same vehicle and is a measure of vehicle occupancy which may be used to estimate passenger-miles.

Unbanded values are in S7.

S8		%
1	One	140,612 37.7
2	Two	140,911 37.8
3	Three	40,551 10.9

15	DNA (not public stage)	329,317
Grand Total		372,665

S31/32 Ticket cost (2)

This applies where a special pass was used, and refers to the estimated cost of a single use of a ticket which may be used for an unlimited number of trips.

The cost of a single stage was estimated from information obtained on the Individual questionnaire about the cost of the ticket/pass, the method of travel for which it was valid (or the methods if it was valid for more than one), how long it lasted for, and how

often it was used. The resulting estimate of stage cost was allocated to each stage where the ticket/pass was used, assuming that the cost for multi-mode trips was proportional to the length of the trip.

The use of travel tokens is recorded at S29 rather than here because they have an identifiable cost per token which was recorded on the trip schedule.

Unbanded values are in S31, recorded in pence.

S32		%
1 No cost	8,542	53.6

S35 Type of ticket

Applies to all public transport stages.

Ordinary adult means the full adult fare for a single trip. Taxi fares were all entered here.

Ordinary child means the full child fare for a single trip.

Reduced ordinary adult, reduced ordinary child, special category reduced, and other (inc. free) are reduced-rate tickets for single or return trips representing reductions offered by the travel operator. Special categories able to travel free or at a reduced ticket in some areas include people of pensionable age, unemployed people, and policemen in uniform. Children under 5 are generally allowed free travel and would fall into this category. Other tickets include free travel available to the general public and tickets purchased as part of a larger package such as a combined hotel and travel booking.

For definitions of special ticket categories, see I185.

S35		%

5.10.5 Private transport

S18 Private vehicle occupant

Applies to stages in private vehicles (other than hire buses). This indicates the type of use of private vehicles. Analyses confined to driver stages may be used to give estimates of vehicle-mileage.

S18		%
1 Front passenger	58,598	21.4
2 Rear passenger	39,417	14.4
3 Driver	176,142	64.2

4 NA	0	
5 DNA	98,508	
Grand Total	372,665	

S19 Where parked

Applies to driver stages in private vehicles. This indicates where the vehicle is parked at the end of the stage. A separate category is provided for stages where the vehicle was not parked but driven off by someone other than the respondent. Street parking includes all parking on the road including parking on the road at home. Other codes are restricted to different forms of off-street parking.

Chapter 6 Definitions Compared with Earlier Surveys

This chapter consists of two parts. The first part summarises the main differences between the current National Travel Survey (NTS) and earlier surveys. The second part is a fuller description on the changes made to the NTS over time.

6.1 Summary of differences for each NTS

The summaries below draw upon comparative analyses of past NTS data and highlight the main effects of the changes in definition, etc. given later in the more detailed descriptions.

The summaries below do not refer to the various treatments of multiple-stop trips, typically trips from shop to shop, known in this report as 'series of calls' trips. Starting with the 1985/86 NTS, a trip to the shops, around the shops and then back again was regarded as three trips with the trip around the shops being treated as a series of calls trip. Previously a trip around the shops was either omitted (1965 to 1975/76) or else included as part of the original trip to the shops (1978/79). When series of calls trips are excluded from analyses of the latest surveys, the number of trips on a shopping trip reverts to that in earlier surveys, i.e. two. It is assumed that the number of trips can therefore be directly compared on this basis, though it is possible that some series of calls-type trips may have been treated as two or more trips in some of the earlier surveys. Analyses of distance travelled normally include series of calls trips. However they are normally short trips and it is assumed that the omission of these trips from the 1975/76 and earlier NTSs does not lead to too much bias in the estimate of distance travelled for these surveys.

1965

- a. Many differences with the 1998/2000 survey.
- b. Information not held on computer files, so analyses restricted to those tabulations prepared immediately after the survey.

1972/73

- a. Smallest sample size.
- b. 30 per cent under-representation of London residents.

- c. Trips by children under 3 not collected.
- d. Database includes information from households that did not co-operate fully with the survey. Analyses are now restricted to fully co-operating households – the same basis as that for more recent survey results. This may lead to differences with figures given in earlier reports.
- e. The number of trips recorded were too high relative to 1998/2000, mainly because trips were more 'broken up' in 1972/73 than in later surveys. In 1972/73, no guidance was given on subsidiary purposes to be ignored in defining trips. For example, stopping for a newspaper on the way to work is thought to have been often coded as two trips in 1972/73 and not one as in later surveys. Also, very short walks under 50 yards were included. The extra trips were mainly shopping trips under 1 mile, and education and entertainment trips of all lengths. For comparisons with 1998/2000, a rough guess would be that the number of trips of 1 mile and over should be reduced by about 10 per cent, those of less than 1 mile should be reduced by about 20 per cent and overall the number of trips should be reduced by about 15 per cent.
- f. The number of escort trips were less than half that on the 1998/2000 survey, mainly because accompanying travellers took trip purpose from that of the person being accompanied and were not coded as 'escort'. Education, shopping and personal business trips were boosted as a result of this switch.
- g. The number of holiday trips were about one-third of that on more recent surveys, whilst day trips were correspondingly a little higher. There is no clear reason for the apparent misclassification in 1972/73.
- h. Evidence suggests that respondents' estimates of walk distance were too high.
- i. Information on trip time and travelling time were less reliable because they were only collected on the 7th day of the travel week.
- j. The type of area variable is biased in favour of larger types of area. In particular, areas with low

population densities were often coded as areas with higher densities. Data on type of area are not therefore strictly comparable with other NTSs.

- k. Population density was given in terms of persons per acre and is therefore not comparable with other NTSs.
- l. Availability of numerical data is severely limited. Only stage distance, time and cost is available. No data are available for health-related travel difficulties, fuel put into household vehicles and a few other topics.

1975/76

- a. No information about children under 3 collected.
- b. 25 per cent under-representation of London residents.
- c. Information on not fully-cooperating households held on the database. See 1972/73 d. above.
- d. The number of trips recorded relative to 1998/2000 was about right, though there was some differences in coding of trip purpose (see e. and f. below).
- e. Under-recording of escort trips. See 1972/73 f. above.
- f. A short walk stage, i.e. over 50 yards, was only included if it was the final or only stage. Attempts to impute short walk stages at the start of a trip from information on trip times were not entirely successful. Walk stages in the middle of trips were not counted at all.
- g. Short day trips, mostly walks, were slightly under-recorded, possibly because interviewers misunderstood the advice to record them only if it was a final or only stage on the 7th day.
- h. Unlike all other NTSs, works/school buses were regarded as being part of the public transport system. In all other NTSs they were treated as private transport. (Note: A new variable has been developed which allows 1975/76 data to be compared with those of other NTSs).
- i. Total trip time and travelling time (though not start time) are unreliable because they were only collected on the 7th day of travel week.
- j. Compared to the 1998/2000 survey, type of area data was biased in favour of less densely populated

areas, mainly because the classification was based on ward level information, not postcode sectors.

- k. Population density data not comparable with other NTSs.
- l. Availability of numerical data severely limited. Only eligible vehicle mileage and journey stage distance, time and cost were available. No data available for health-related travel difficulties, fuel put into household vehicles and a few other topics.

1978/79

- a. Very poor response rate. Car-owning households were badly under-represented.
- b. 40 per cent under-representation of London residents.
- c. The number of trips recorded was too high relative to 1998/2000. Shopping and social trips were particularly over-recorded. It is assumed that this is because the interviewers 'broke up' trips to a greater extent than in 1975/76 or in later surveys and included more trips with just subsidiary purposes.
- d. Under-recording of escort trips. See 1972/73 f. above
- e. Day trips under 1 mile, mostly of the 'just walk' category, were almost half that expected. Possibly this was because the code was split into two on the questionnaire – day trip countryside and day trip other – neither of which may have seemed appropriate for a short round trip walk.
- f. Type of area data biased in favour of less densely populated areas. See 1975/76 j. above.
- g. Population density data not comparable with other NTSs because derived from a special method to link the data with the 1971 Census.
- h. Availability of numerical data a little limited; e.g. age only available from 18 groups of age ranges. No data available for health-related travel difficulties, fuel put into household vehicles and a few other topics.

1985/86 and continuous survey 1988 onwards

- a. The sample designs and questionnaires of the 1985/86 ad hoc survey and the first years of the continuous survey (July 1988 to December 1991) were virtually identical.

- b. About 14 per cent under-representation of London residents in 1985/86 and in 1989/91.
- c. Some new questions were introduced from the start of 1992 and a few were dropped to accommodate these additions. Fieldwork and sampling arrangements were altered in 1992 in order to provide a more even spread of travel information throughout the year.
- d. The sample of addresses in London was increased from January 1993 in order to compensate for the lower response rates in London. The sample for the rest of Great Britain was cut at the same time. Comparisons of London bus and LT Underground travel before and after January 1993 should therefore only be used with caution.
- e. The introduction of Computer Assisted Personal Interviewing (CAPI) in October 1994.
- f. To deal with continued falls in response, the overall sample size was increased in 2000. The size of primary sampling units (PSUs) was increased from 21 to 23 addresses, and the total number of PSUs was increased from 240 to 252. A disproportionate number of the additional PSUs were placed in London, thereby further 'boosting' the London sample, since response rates in London had again fallen further than those in the rest of Great Britain.

6.2 Detailed list of changes in procedure and definitions between the continuous survey and earlier surveys

I. Definition of a journey/ trip

1965

Travel off the public highway was included in the survey. A journey (now known as a 'trip') was defined as 'a one-way course of travel having one single main purpose'. Examples of subsidiary purposes were given.

1972/73

Walking and travelling by vehicle was only included if on or by public roads. Interviewers' instructions did not advise whether, for example, 'stops to get a packet of cigarettes on the way home' constituted a separate trip purpose.

1975/76

Travel off the public highway (e.g. in private gardens, across parks or open country, or on public footpaths or private land) was excluded. The definition manual specified examples where the subsidiary purpose was trivial, incidental and to be disregarded. Otherwise the ruling was the same as in the previous surveys but it is possible that the more precise written advice in 1965 and 1975/76 affected the number of trips recorded.

1978/79

As 1975/76, except that walking around the shops was also included.

1985/86

The definition manual was re-written to give more emphasis to the criteria to be used by interviewers in deciding how to break travel into trips. The most important was the respondent's opinion; others were the effects of minor objectives on trip time and on the route taken.

A new concept was introduced to deal with trips containing multiple stops. *Series of calls* were trips made up of frequently broken travel between many stops. See notes on shopping trips below.

Continuous survey

As 1985/86, except that interviewers were instructed to restrict the use of *series of calls* to single-stage trips made for the purpose of either 'shopping' or 'in course of work'.

II. Trip purpose

1965

The purpose of a trip was defined by its destination, except in cases where the trip was made to home in which case the purpose was determined by the place of origin. There is a possibility that more trips made on holiday were missed than in other surveys because the number of days between the contact interview and start of the travel period was kept short. Shopping trips were separated into 'convenience' and 'goods'.

1972/73

The interviewers instructions were less specific: for overall trip purpose it was stated that 'the trip home-ward takes the same purpose as the trip outward'. It is not clear (for example, for trips from home to shops, shops to friends then friends to home) how outward was interpreted; neither is it clear, for example, for

trips from work to shops and back, how homeward was to be interpreted.

On the 7th day only, *trip purpose from* and *trip purpose to* were generated from origin and destination land use codes together with the overall *trip purpose*. Where the land use origin or destination was *home* the trip purposes from and to could be generated directly. In other cases the *trip purpose from* was based on the destination of the previous trip, while *trip purpose to* took the same value as the overall trip purpose. Difficulties with unknown land use led to the under-recording of holiday trips. These definitions are not directly comparable with the later surveys.

After one month in the field several codes were changed from the 1965 definition to the 1975/76 definition; i.e. sport was sub-divided into 'watching' and 'participating' and holidays and day trips were split.

1975/76

On all days of the recording period, overall purpose was derived from recorded information of *trip purpose to* and *trip purpose from* e.g. from 'work' to 'shops'. The *trip purpose to* was the overall purpose in all cases except where it was 'home' in which case the *trip purpose from* applied.

1978/79

Derived as in 1975/76. However the inclusion of the 3-week car diaries, which had a different trip purpose structure, led to some changes. In particular, holidays, which in 1975/76 were defined as 'at least one night away from home for leisure/recreation purposes', in 1978/79 excluded staying with friends or relatives for 1-3 nights. Instead these short stops with friends were coded as social. The changed treatment of shopping round trips and walking between shops (see below) led to an increase in shopping and personal business trips.

The holiday and day trip purposes were sub-divided into 'countryside' and 'elsewhere'.

1985/86

The main change from 1978/79 was to extend the 'escort' category to include trips accompanying others. For instance, a child taken shopping by an adult would be classified as 'escorting' in 1985/86, rather than as shopping, as was the case in 1978/79. The 1985/86 dataset identifies the purpose of the person accompanied or escorted as well as the main purpose where this was escorting.

Other changes were made to the grouping of purposes, but definitions were generally as in 1978/79. An extra category was introduced for 'personal medical business' to identify trips to receive medical advice or treatment.

Continuous survey

New overall trip purpose categories were introduced. 'Commuting' was strictly home to work and work to home trips. 'Business' was defined as trips to 'in course of work' and from 'in course of work' to either home or work. 'Other work' included all other trips to work, for example returning to work from a visit to the shops in the lunch break.

The 'escort' categories were simplified. The new categories for *trip purpose to* and *trip purpose from* were: escort home, escort work, escort in course of work, escort education, escort shopping/personal business and other escort. These were then used to derive the new overall *trip purpose* categories of escort commuting, escort business and other work, escort education, escort shopping/personal business and escort home and other escort.

III. Round trips

1965

Round trips (starting and finishing at the same point) were split into 2 (both apparently with the same purpose).

1972/73

Interviewers were asked to leave the next trip space blank when there was a round trip (in order to prevent confusion). The trip was to be split into 2 at the editing stage. However, there is some evidence that round trips were treated inconsistently by interviewers.

1975/76

The definition manual used was less confusing on round trips. Interviewers were instructed to divide a round trip into 2 trips, outward and homeward. Travel involving a continuous series of calls made for the same purpose (by a doctor, for example) was treated as a round trip.

1978/79, 1985/86, Continuous survey

As 1975/76, but see shopping trips overleaf.

IV. Shopping trips

1965

Walks in the course of shopping were excluded.

1972/73

Walks in the course of shopping were deleted at the editing stage.

1975/76

Walks and private vehicle trips in the course of shopping in the same shopping centre were excluded.

1978/79

A round trip for the purpose of shopping was treated as a round trip with the 2 trips being to and from the last shop. Thus walks or private vehicle trips in the course of shopping were included. If a mode of transport other than walking was used to get from one group of shops to another then that mode and the subsequent walking were treated as separate trips.

1985/86

Trips involving many stops, of which shopping trips are the typical example, were treated in a new way using the concept of a *series of calls*. Travel between the first and last shops was coded as a separate trip, and the preceding trip represented travel only to the first shop, while the following trip represented travel from the last shop (as before). Thus, in 1985/86, two trips were counted where, in 1978/79, there was only one. For consistency, *series of calls* should be excluded from counts of trips; however, the distance travelled on such trips should be included in analyses of distance travelled. *Series of calls* represented less than 2 per cent of the final sample, a lower proportion than had been expected. The explanation may be that most travel which could be treated this way was walking between shops covering an overall distance of less than 1 mile, so that the series of calls trips was out of scope on six days out of seven.

Continuous survey

The definition of *series of calls* trips was made more restrictive - see I. above.

V. Walking jobs

1965

Travel in the course of work by policeman and postmen was specifically excluded. Where the main paid employment was less than 10 hours a week the travel to work was recorded as being in course of work.

1972/73

Walks by traffic wardens, policemen, etc. were included under 'in course of work'. Driving jobs were excluded.

1975/76

Both walking and driving jobs were excluded.

1978/79, 1985/86, *Continuous survey*

As 1975/76.

VI. Short walks

1965

Short walks, under one mile, were excluded altogether.

1972/73

On the 7th day short walks were recorded separately, as a separate stage. However some interviewers ignored very short walks (e.g. to the car) whilst others included them.

1975/76

On the 7th day, a short walk over 50 yards was recorded as a separate stage but only if it was the final or only stage. In most cases a walk stage was generated during computer editing when the trip sheet recorded that some minutes had been spent walking prior to the bus, train, etc. stage. In a large number of cases, it was difficult to allocate the main mode of the trip, because the length of a short walk was not known (see below).

1978/79

On the 7th day all short walks over 50 yards were recorded as separate stages. Walking around the shops, as well as to and from the shops, was included (but not around shopping precincts).

1985/86

As 1978/79, but walking in a precinct that was permanently open as a public thoroughfare was included.

Continuous survey

As 1985/86.

VII. Length of walk

1965

Respondents' estimates of distance were used. More long walks would be expected because of the inclusion of travel off the public highway.

1972/73

Respondents' estimates of distance were used. 'No answers' formed only a small proportion of responses. There was evidence that respondents tended to overestimate distances walked.

1975/76

To overcome the 1972/73 problem, distance walked in general, and in particular the length (in miles) of walks preceding a further stage in the same trip, was estimated by dividing the respondent's estimate of time taken (in minutes) by 20. This was obviously an approximation, possibly an under-estimate on average. Distance comparisons between 1972/73 and 1975/76 are distorted. A large number of the walks preceding a car, train, etc. stage had no time estimate. Therefore, a short walk was recorded, but of unknown length. This had serious implications for the main mode, as shown below.

1978/79

Respondents' estimates of distance were used, although travelling time was also recorded. If distance was not given it was estimated at the computer editing stage from travelling time (where known) divided by 20. More long shopping walks would be expected because of the inclusion of the distance travelled between shops.

1985/86

As 1978/79, except that missing data were estimated by dividing travel time in minutes by 25, not 20. Very few records had distance missing.

Continuous survey

As 1985/86.

VIII. Main mode of transport

1965

The main mode of transport was coded as the mode used in the longest (distance) stage. If 2 stages were the same length the earlier stage mode was used, i.e. the one with the lower stage number.

1972/73

As 1965

1975/76

The 1965 method was used. However, in a large number of cases, the length of a stage was not known. As a result, it was not possible to know the longest stage of the trip. Analysis of these trips has shown that it was mainly two stage car trips and multi-stage bus trips that were affected. This is because it is these types of trips that were most likely to include one or more walking stages (see problem with short walks above). For 7th day data some 15 per cent of trips had no main mode coded. This affected the main modes (such as bus), which were likely to have been associated with short walk stages, much more than main modes, such as bicycle, which often did not involve walking. When all seven days data are used the overall modal split is not seriously affected, although for comparison with other data the under-recording (of up to 3–4 per cent for certain modes) can be more of a problem, e.g. for numbers of trips per person. The estimates of length of trip and counts of mileage were also affected, although it is often possible to overcome this problem by using stage mode instead of main mode.

1978/79

The main mode of transport was coded as the mode used over the longest (distance) stage. If 2 stages were the same length then the first or second was selected at random. Walk stages where both length and time were unknown were ignored and only the other stages in the trips were used to produce main mode. A secondary mode is also available, the second longest stage in a multi-stage trip.

1985/86

Similar to 1965; where two or more stages had equal length, the mode of the latest stage was taken. If any stage length was missing, main mode was not coded until 'patching'.

Continuous survey

As 1985/86.

IX. Mode of transport

Some bus services were shown separately in earlier National Travel Surveys.

Works/school bus trips on the 1975/76 NTS were treated as other public transport. A revised grouping has been produced which includes these trips as other private transport, the classification used on all other National Travel Surveys.

Public tour/excursion bus stages were included with public express bus stages in 1975/76, and not identified separately.

X. Trip start time and travelling time

1965

Information on trip start time and travel time was not collected.

1972/73

On the 7th day information was collected on the trip start time, overall trip time and stage travelling time for each stage, excluding waiting.

1975/76

Trip start time was collected throughout the travel week. On the 7th day total trip time and travelling time for each stage (excluding waiting) were collected.

1978/79

Trip start time, total duration time and travelling time for each stage were collected throughout the travel week.

1985/86, *Continuous survey*

As 1978/79.

XI. Treatment of part miles

1965

Distances were recorded to the nearest half mile for distances of less than 5 miles and to the nearest mile for distances of 5 miles or more.

1972/73

Distances were allowed down to quarter miles but edited into tenths of a mile. A quarter of a mile was recorded as 2 tenths, three quarters as 8 tenths.

1975/76

Distances were allowed down to quarter miles but edited into tenths of a mile. A quarter mile was recorded as 3 tenths, three quarters as 8 tenths. Distances of 4, 6 or 7 tenths were not allowed.

1978/79

Distances were coded as tenths of miles. Where respondents quoted a quarter of a mile this was coded as 2 tenths, three quarters of a mile being coded as 8 tenths.

1985/86, *Continuous survey*

As 1978/79.

XII. Type of area

1965

In the absence of the 1966 de facto urban area analysis, a more subjective estimate for type of area was used. It was based partly on the classification of district councils into urban and rural, partly on the advice of planners and partly on density of population data from the 1961 Census. For these reasons it is not comparable with the other surveys.

1972/73

Local authorities were, in general, coded to the largest type of area containing any part of the local authority, based mainly upon an unpublished analysis of the 1966 Census: 'De Facto Urban Areas in England and Wales, 1966'. This makes the sample appear biased in favour of the larger type of area. As a result it is not comparable with the other surveys. It should be noted that the 235 areas with populations under 3,000 considered to be 'urban' in the original 'De Facto' exercise have been counted as 'rural' in all NTS analyses.

1975/76

The 1966 de facto urban area analysis was used but at ward level rather than local authority level, thus eliminating the 1972/73 bias. The 1966 classification of areas may have become out of date due to shifts of

population from densely populated to less populated areas.

1978/79

The 1966 de facto urban area analysis was used to classify each 1978/79 ward. In a number of cases it was possible to identify the 1978/79 ward with a pre-1974 local authority area and hence to find the appropriate classification. In other cases the centroid of the 1978/79 ward was calculated and then located on a map of the 1966 de facto urban areas to find the appropriate classification. The 1978/79 and 1975/76 methods used were sufficiently similar for the results to be regarded as comparable.

1985/86

A new classification was derived using the urban areas defined for England and Wales for the analysis of the 1981 Census (OPCS, 1984), and localities in Scotland defined by the Scottish Office (GRO(S), 1984). Postcode sectors were classified according to the nature of the dominant type of area represented in the sector. Urban areas with a population below 3,000 were regarded as rural.

Continuous survey

As 1985/86 for years up to 1992. For 1993 onwards the 1991 Census was the basis for the definition of urban areas.

XIII. Population density

1965

Based on the 1961 Census, this variable was the population density of the ward or group of parishes in which the household was sampled.

1972/73

Based on the preliminary report from the 1971 Census, and acreage from the 1966 Census county reports. This variable was the population density of the local authority in which the household was sampled.

1975/76

Based on the 1971 Census, both the population densities of the ward and the local authority in which the household was sampled were estimated. The data were given in persons per hectare rather than per acre, but the grouping was made to correspond closely to that used in other surveys.

1978/79

Ward density could not be calculated for the wards used in 1978/79 as they were often very different from those used for the 1971 Census. Therefore the method used was to draw a circle around the centroid of the ward sample and accumulate 1971 Census data for all 1971 enumeration districts whose centroids fell within the circle. Each ward was then classified according to the data accumulated. The 1978/79 analysis is not comparable with the other surveys.

1985/86

The population density figures, for local authorities and for the postal sectors comprising the primary sampling units, were taken from the ONS sampling frame, which is based on the Postcode Address File. Population figures were from the 1981 Census.

Continuous survey

As 1985/86 for years up to 1992. For 1993 onwards the population density figures were taken from the 1991 Census.

XIV. Household income

1965

Of responding households, 21 per cent failed to supply full information on the income question.

1972/73

Of responding households 16 per cent failed to give information on income. However, there were a further 334 households with zero income, of which 332 were miscoded. In practice it is reasonable to assume that most of these 332 households belonged to the lowest income band.

1975/76

Of responding households 31 per cent refused to give their income, and a further 36 households said they had zero income. In order to overcome this high refusal rate a procedure for estimating the household income of the non-respondents was devised. This was based on the number of employed members, the income of the head of household, the socio-economic group of the head of household, and the number of cars in the household.

1978/79

A question on actual income was asked of each individual and only if this was refused was the question attempted in terms of bands of income. Of responding households, 31 per cent gave full information, 35 per cent partial or banded income from which an estimate was possible, and 34 per cent gave insufficient income information to enable household income to be estimated directly. A similar technique to that used in 1975/76 was used to estimate the household income of the 34 per cent using: the number of full-time employed members, the number of cars in the household, the working status of the head of the household, and household structure.

1985/86

Income was requested only as a banded estimate. A figure was obtained for 85 per cent of the fully-responding households in the database. Missing information was estimated in a similar fashion to the previous two surveys.

Continuous survey

As 1985/86.

XV. Walking time to various facilities

1965

Walking time to the bus stop or railway station was based on the respondent's estimate of how long it would take him (the respondent) to walk there. It was asked of all persons.

1972/73

As 1965

1975/76

Walking time to various facilities was based on the respondent's estimate of how long it would take the interviewer to walk there.

1978/79, 1985/86, *Continuous survey*

As 1975/76.

XVI. Miscellaneous differences

1965

Business expenses for motoring were not collected.

1975/76

Information on the value of the car was not collected. A system of identifying duplicated trips was used in order to save interviewer (and respondents') time. This was further developed in 1978/79 and in 1985/86.

1978/79

Travel of children under 3 was included for the first time.

1985/86

New questions were asked about the use of particular modes of travel, health-related travel difficulties, fuel put into household vehicles, and the number of boardings during the use of a single ticket on a particular trip. A number of questions including make and model of car, value of car and a split of annual vehicle mileage into business, commuting and other were dropped.

The vehicle database and that of later NTSs was split into two during 1994. Those cars believed to have been available to the household at the start of the travel week were designated primary vehicles, the rest were deemed secondary vehicles. Information about primary vehicles is now used for all standard analyses of vehicles, as these represent a point estimate of the vehicle stock. Information on the other vehicles is only used for analyses of journey stages by household vehicles during the travel week.

Continuous survey

From July 1988 a fuel and mileage chart was placed in the vehicle at the beginning of the travel week. This led to an increase in the accuracy of NTS estimates of vehicle mileage, making it more comparable with estimates from other sources.

Changes introduced from 1992 to 1994

From January 1992, some additions to the questionnaire were made. The origins and destinations of trips were collected, and also the make and model of cars and vans.

Summary details of 'long distance' trips of 50 miles or more in the three weeks preceding the travel diary week were added to improve the coverage of these important but less common trips. A number of other minor changes were made, including the dropping of questions about the time taken to reach various local services and amenities. The income bands used were also updated in 1992.

In January 1992 some changes to the placing pattern of interviews was introduced. After a transitional quota period in the first half of January 1992, all interviewer quotas from this point on ran from mid-month to mid-month. This has improved the coverage of bank holiday travel.

From mid-January 1993, the set sample size of Inner London Boroughs was increased from 12 to 15 interviewer quotas per year, whilst that for Outer London boroughs was increased from 18 to 20. A compensating reduction of 5 quotas outside London was introduced at the same time so that there was no overall change in the set sample size. The change was introduced to address the perennial problem of the under-representation of London residents in the achieved sample, due to lower response rates and other factors.

In 1993, opinion questions on bus services and a question on the split of annual vehicle mileage between commuting, business and other private were introduced.

More details of the changes in 1992 and 1993 can be found in Appendix B of the 1991/93 report.

Changes introduced in 1995

In 1995, a number of changes were made to the questionnaire. Questions on disability and travel difficulties were restricted to those aged 16 and over, and new questions were introduced for disabled drivers. New questions on parking facilities at home were introduced.

The industry grouping and income bands used were also updated in 1995.

Changes introduced in 1998

From January 1998, a large number of harmonised questions were introduced onto the questionnaire, mostly as replacements for existing questions or question blocks. A full list of the harmonised questions introduced can be found in Chapter 3 of this report. In January 1998, several other questions were also added. These were the questions on the time taken to reach various local services and amenities, which had been dropped in January 1992.

Changes introduced in 1999

In 1999, the placing pattern for diaries was altered, in order to allow more chance for a full response, by giving interviewers more time to contact households

within the quota month. Firstly, in May, diary start dates were allocated on a first-come, first-served basis, but within the restriction of interviewers having to contact the households in a pre-determined (random) order. This was altered again in September, from when interviewers were allowed to contact households in any order.

Also in 1999, two further harmonised questions were added, covering marital status and living arrangements.

Changes introduced in 2000

In 2000, there were some significant alterations to the sample of the NTS, intended to halt the continued decline in the achieved sample resulting from increasing non-response. The size of each PSU was increased from 21 to 23 addresses. Furthermore, the total number of PSUs was increased from 240 to 252, giving a new total of 5,796 addresses in the starting sample, compared with the old total of 5,040. A disproportionate number of the additional PSUs were placed in London, to compensate for the even worse response problems in this area.

Several additional harmonised questions were included from January 2000. Details of these can be found in Figure 3.2 of this report.

New questions on cycling were also added during 2000.

Chapter 7 Comparison of 1998/2000 NTS data with other sources and with previous surveys

7.1 Age and sex of NTS respondents

In 1998/2000, the NTS slightly under-represented males overall, but particularly those between the ages of 21 and 39 (Table 7.1). The perennial problem of getting young males to respond to surveys was a little worse on the NTS than the General Household Survey (GHS),¹ possibly as a result of the time-consuming diary element to NTS. Between the ages of 21 to 29, the NTS had a deficiency of 27 per cent for males and 12 per cent for young females, which was worse than in 1995/97, when the deficiencies were 24 per cent and 8 per cent respectively. This particularly affects data on travel by bicycle and motorcycles, which are used more frequently by young men.

As in the GHS, children and the elderly were over represented in the NTS, although there was a small shortfall among the most elderly women.

7.2 Region of residence of NTS respondents

Table 7.2 gives details of response for the Government Office Regions of England, and for Scotland and Wales. The North East, South West and Wales were over represented, and the North West & Merseyside, East Midlands and West Midlands were under represented. Up until 1992, the NTS had a consistent shortfall in the number of respondents from London. To compensate for this, the number of sampling units in London was boosted from January 1993. Following further drops in response in the latter part of the 1990s, this boost was increased in 2000.

7.3 Vehicle stock

Table 7.3 gives estimates of vehicle stock from the NTS, compared with data from the Driver and Vehicle Licensing Agency (DVLA). In most years, the NTS estimate of vehicle stock was lower than the DVLA estimate, although the pattern has not been consistent.

Table 7.1 Comparison of the distribution of age and sex of the NTS sample with the mid-year population estimates

	1998/2000 NTS sample		Population estimate (average 1998–2000)		<i>percentage</i> NTS Percentage over-representation	
	Male	Female	Male	Female	Male	Female
0–4	3.2	3.5	3.1	3.0	-	17
5–10	4.1	4.0	4.0	3.8	1	4
11–15	3.3	3.2	3.2	3.1	3	4
16–20	2.7	2.7	3.1	2.9	-14	-7
21–25	2.1	2.6	3.2	3.0	-33	-14
26–29	2.3	2.8	3.1	2.9	-25	-4

2. Provisional.

7.4 Car mileage estimates

The NTS provides two estimates of annual vehicle mileage - from travel in the diary week and from the main driver's estimate of the annual mileage. Table 7.4 describes the calculation which compares these two figures with that obtained from estimates of traffic derived from the National Traffic Census and estimates of vehicle stock from the DVLA. Table 7.5 gives comparisons for individual years of the continuous NTS and earlier ad hoc surveys.

The driver's estimate is confirmed as the best measure of car mileage from the NTS. These estimates were in close agreement with those derived from the DVLA data since the 1985/1986 survey, whereas the weekly milometer

readings are over 10 per cent lower in recent years. The deficiency of the weekly milometer readings is thought to be mainly the result of the difficulty in placing travel diaries with people during periods when they are most active, such as Bank Holidays.

The table also shows annual figures derived from grossing data recorded for individual stages in travel diaries. These are lower than weekly milometer figures, as ineligible mileage is excluded, and there is more likely to be under recording when trips are missed.

Notes

- 1 See Appendix B of *Living in Britain*, results from the 1998 General Household Survey: The Stationery Office, 2000.

Table 7.4 Comparison of NTS car mileage estimate for 2000 with other sources

Estimated traffic of cars and taxis, GB 2000 (billion vehicle miles)	235.4
	(=378.7 bn km.)
<i>less traffic of:</i>	
non-household cars	16.9
vehicles other than car body types	4.2

Chapter 8 Sampling Errors

8.1 Introduction

Estimates of population values (e.g. means or proportions) made from a random sample survey are dependent upon the particular sample chosen – a different sample selected will produce different estimates of the population figures. The estimates deviate from the true population values by varying amounts; these deviations are known as the sampling error and are, in theory, randomly distributed. The likely size of the sampling error or precision is measured by calculating the *standard error* of the estimate. This precision can also be expressed in terms of a *confidence interval* about the sample estimate. A 95 per cent confidence interval is the range of values contained within 1.96 standard errors of the survey estimate. If the survey were repeated many times under the same circumstances we would expect such a confidence interval to contain the true value 95 per cent of the time. For example, the number of trips per person per year is estimated for 1998/2001 as 1,030 with a standard error of 7.3. Hence the 95 per cent confidence interval is $[1,030 \pm 1.96 \times 7.3]$ or $[1,016 \text{ to } 1,044]$.

Survey estimates are usable only if the standard errors are small, or put another way, that the estimates have the necessary precision for the particular purposes to which they are put. The size of a standard error depends upon three factors: the size of the sample; the survey design; and the variability in the population of the attribute being measured.

In general, the larger the sample size the smaller the standard error of a generated statistic. The standard error reduces in proportion to the square root of the sample size – hence a four-fold increase in sample size causes a two-fold reduction in the standard error. For small sub-samples of the population (e.g. households, individuals and vehicles) the standard error is related to the size of the sub-sample. Therefore it is generally inadvisable to generate estimates of subsample parameters for sub-sample sizes of fewer than 100, while sub-samples of fewer than 300 should be used cautiously. For trip and stage estimates, even more caution should be exercised; sub-samples under 300 should not be used to generate estimates, whilst sub-samples of under 1,000 should be used cautiously.

8.2 Sampling error calculations and tables

Simple random sample (SRS) designs¹ are costly in terms of the travelling times of interviewers, as the

sampled addresses would be spread evenly across the whole of Great Britain. So the NTS, like most other household surveys, uses a multi-stage design which groups addresses on the sampling frame into clusters of relatively small areas before sample selection. These areas, known as primary sampling units (PSUs) can economically be covered as one interviewer's quota of work. The PSUs on the NTS are postcode sectors, or groupings of sectors. This design tends to lead to larger standard errors than an SRS would, because the PSUs are usually more homogeneous than the population as a whole. This is offset to some extent by the stratification of the sampling frame (see section 2.2.2).

Sampling errors can be calculated for all the estimates derived from the National Travel Survey. However, the multi-stage design of the survey makes computation of sampling errors more complicated than if the survey was a simple random sample. The NTS analysis system requires two additional pieces of information for the calculation of sampling errors: the five-digit area number can be used to identify and arrange the PSU selections in the correct order; the first two digits of the area number identify the major strata (region). Once the PSUs have been ordered within major strata they are paired with the following PSU to form minor strata.² The formula used to calculate the standard error of an NTS estimate, r , is as follows:

$$SE(r) = \sqrt{\sum_{pair} \frac{a}{(a-1)x^2} \sum_{i=1}^a (z_i - \bar{z})^2}$$

Where;

r	=	statistic being considered, i.e. the mean or proportion.
a	=	no. of PSUs
z_i	=	$y_i - rx_i$
\bar{z}	=	minor strata mean
y_i	=	the sum of the statistic in PSU i i.e. The total if r is a mean or the number of occurrences if r is a proportion
x_i	=	sample size in PSU i
x	=	$\sum x_i$

Full mathematical details were given within Section 6 in Part 2 of the 1985/86 NTS Report.³

The effect of the sample design on the standard error of an estimate is calculated as the complex standard error divided by the standard error that would be achieved with an SRS, and is called the Design Factor (DEFT). The size of the DEFT varies from one estimate to another depending on the relative homogeneity of households (or individuals) within PSUs with respect to the estimates being measured. DEFT increases with average PSU size. Therefore DEFT tends to be particularly large for trip and stage data, since there are many more trips and stages in a PSU than there are households and individuals. Also, the trips made by a household tend to be similar. Thus the precision of the trip - and stage-level estimates is considerably less than might be supposed from their total sample size.

The 95 per cent confidence limits and DEFT are given for each estimate shown in the tables on the following pages, together with the sample size,⁴ or base, on which the estimate was based. For a quick estimate of the confidence limits for any estimate not shown below, use the sample size and estimate which best approximates to the one required. Adjust as necessary, bearing in mind that the standard error, and hence the 95 per cent confidence limits, are proportional to $1/\sqrt{n}$, where n equals the size of the sample being considered.

Notes

1. A sample where each selection is statistically independent and made in the same way, has a fixed sample size, and gives each population element the same chance of selection.
2. Sometimes a 'pair' will contain 3 PSUs if there is an odd number of PSUs within the major stratum.
3. *National Travel Survey 1985/86 Report*. HMSO, 1988.
4. For trip and stage estimates, weighted sample sizes are shown (weighted for short walk trips).

Table 8.1 Proportions for Households

<i>Households/percentage</i>				
	Base	Estimate	95% confidence range	DEFT
0 cars	9,390	28.5	1.0	1.12
1 car	9,390	45.2	1.0	1.03
2 cars	9,390	22.5	1.0	1.13
3 or more cars	9,390	3.9	0.4	0.98

Chapter 9 National Travel Survey Quality Review 2000

This chapter reproduces the main report to the National Statistician of the NTS Quality Review.

See paragraph 5 below for details of the full report.

Introduction

1. The National Travel Survey (NTS) is commissioned by the Department of Transport, Local Government and the Regions (DTLR). It is a household survey that provides users with information on personal travel within Great Britain, by residents of GB. Respondents complete a detailed seven-day travel diary. Outputs include annual publications and fact sheets containing details on how and why people in different groups of the population travel, and a database used to answer ad hoc enquiries.
2. The NTS has run continuously since mid-1988 with no major changes in structure or sample size. In 2000, the set sample was about 5,800 households. The sample size was designed to produce reliable estimates of the main survey variables at GB level by the aggregation of data over a three-year period.
3. The fieldwork is currently conducted by the Social Survey Division of the Office for National Statistics (ONS), but analysis and publication of results are the responsibility of DTLR. The current fieldwork contract with the ONS expires at the end of 2001, which provides an opportunity to consider if changes are needed so that the survey meets its users' needs in the most cost effective way.
4. The NTS was one of the first outputs under the 'Transport, Travel and Tourism' (TTT) theme of National Statistics to be subject to a Quality Review. The main components of this review were:
 - a project definition document (Annex A in full report);
 - consultation on customers' needs (Annexes B to D);
 - a methodology review (Annex E);
 - the response by DTLR to the consultation and methodology review (Annex F).

5. This report and the detailed main annexes associated with the Review are also available at www.statistics.gov.uk/nsbase/methods_quality/quality_review/transport.asp

Scope of the Review

6. The overall **aims of the Review** were to identify the following:
 - coverage of the NTS (particularly to make sure there are no gaps in provision of travel data that could be filled by the NTS);
 - fitness for purpose of the NTS outputs;
 - to consider the sample size;
 - appropriateness of the survey methodology;
 - methods of dissemination.
7. The work of the Review Study Team has been overseen by a **Project Board/Steering Group**, consisting of
 - Mike Hughes, Transport Statistics (DTLR Head of Profession)
 - Professor Kay Axhausen, ETH, Zurich (external academic advisor)
 - Professor Peter Jones, University of Westminster (external user)
 - Bronwyn Hill (to Dec 2000), Transport Strategy Division (internal user)
 - Mike Walsh (from Jan 2001), EcLTG Division (internal user)
 - Caroline Bustard, ONS (Quality Assurance Programme Manager)
8. Until December 2000, the review was managed by Peter Capell, Head of TSPT Division of the former DETR (Department of the Environment, Transport and the Regions). Hilary Hillier took over this role in January 2001.
9. The review was carried out by a **review study team**, consisting of:
 - Barbara Noble, NTS Statistician, DTLR

- Dave Elliott/Charles Lound, Methodologists, ONS
- Drew Hird, Assistant Statistician, DTLR

Consultation on customers' needs

- Internal users of the NTS were initially consulted on their needs in a general review of Transport Statistics, which reported in November 1999. Further consultation on their needs for personal travel data took place early in 2000, and internal users were also able to take part in the external consultation if they wished.
- The DTLR issued about 200 copies of a **questionnaire** (Annex B) to external users in August 2000. This was also made available on the NS website within the TTT theme. Replies were received from 61 people, including 17 from transport consultants, 9 from academics, 14 from central government users, and 16 from local government. Glyn Rhys-Tyler of the Transport Research Laboratory helped with the analysis of the replies as a representative of the Transport Statistics Users' Group (TSUG). The questionnaire covered the following topics:
 - respondent's details and current use of NTS;
 - current format of NTS;
 - survey methodology details;
 - questionnaire topics;
 - diary format;
 - data processing;
 - data access;
 - dissemination of results.
- In addition, a seminar for users was held on 6 September 2000, under the auspices of DTLR and TSUG. Fifty external users and a number of internal users attended.
- The main themes emerging from the questionnaire and seminar are listed below.
 - Almost all users wanted the National Travel Survey (NTS) to continue in a broadly similar form, with all members of a household completing a seven-day travel diary.
 - The inclusion of students in halls of residence would be welcomed, as would travel by non-GB residents.
 - Many users wanted to be able to disaggregate data to finer geographic detail, or by single years. These needs could be met by increasing the sample size of the survey.

- A number of suggestions for new questionnaire topics and extra diary details were made. In particular, the collection of short walk data on more days was frequently mentioned.
- Designing a set of core questions to be asked every year, with rotating questions on other topics was welcomed by a majority of users.
- Some users wanted more information on origins and destinations of journeys, including geocoding and land use.
- The use of questionnaire data from 'partially responding' households who failed to complete diaries was favoured.
- A number of users considered a non-response survey to be important, and that some form of weighting to overcome non-response bias was necessary.
- The possibility of running tables from a web-based interface was welcomed.
- No overwhelming need to use new technologies was expressed, but the possibility of a web-based diary, or a diary on a hand-held personal computer could appeal to younger users, who were more difficult to motivate.

- Detailed reports are available of the seminar in Annex C, and the consultation in Annex D, which also contains a list of organisations that attended the seminar and/or responded to the consultation.

Methodology review

- This review (Annex E) was carried out by Dave Elliot of ONS, with the assistance of Charles Lound. The main areas considered were:
 - sample size and design;
 - diary length and placing pattern;
 - non-response and weighting.
- The recommendations of the Review are listed below. Those marked * depended on the sample size increasing.
 - The Department should consider making more use of rolling 3-year aggregates when assessing change or reporting trends.
 - The Department should assess the relative importance of estimates of current level and change, then consider introducing a panel element into the design.*
 - The Department should reconsider the size of the current London boost and should post-stratify the sample to the correct regional distribution.

- d. The Department should repeat the assessment of optimal stratifiers once the 2001 Census data become available.
- e. The Department should consider (a) reinstating the population density and car-to-work stratifiers or (b) deep geographical stratification to improve small area estimates.*
- f. The current use of postcode sectors or similar-sized areas as primary sampling units should be retained. Some variation in sample size within sectors could be countenanced.
- g. The Department should apply weights to correct the bias against multi-household addresses.
- h. The Department should retain the current placing pattern but keep it under review by collecting relevant response data.
- i. The Department should retain the current mid-month to mid-month field periods, unless this significantly increases their costs or limits their output options. A more thorough analysis of the impact should be undertaken before any change is made.
- j. If the decline in response rates continues, the Department should consider a range of measures including incentive payments, the use of a shorter diary and a switch to retrospective recall to eliminate the need for diaries completely.
- k. The Department should introduce non-response weighting on the survey, taking note of the recommendations of the GSS Task Force on Weighting.
- l. If possible, the Department should commission ONS to repeat the Census-based assessment of non-response bias after 2001.
- m. The Department should continue to investigate the potential use of data from partially-responding households with a view to using as much of this data as possible in NTS estimates.
- n. The Department should assess the quality and impact of its imputations and the use of other statistical approaches.

Response to consultation and methodology review

17. The full DTLR response is given in Annex F. All the recommendations listed in section 16 above have been accepted. A programme of work to implement these changes has started. A number of changes will be made to the NTS from January 2002. The most significant is that Ministerial approval has been given to increase the set sample size considerably, to about 15 thousand households per year. Work will

continue on detailed implementation, such as weighting and revised imputation, until the first results of the new NTS are available in autumn 2003. More details of this programme of work are given in the last section of this report.

18. Most of the requirements expressed by users will be met, subject to practicality and cost. In summary, the following requirements have been accepted:
 - the same basic survey design, but with an increased sample size;
 - the addition of students living in halls of residence to the sample frame, subject to a satisfactory pilot study;
 - geocoding of diary details, for Day 7 only to reduce the burden on respondents;
 - the addition of simple diary details of long distance journeys made outside GB, subject to satisfactory pilot study;
 - non-response survey, and weighting to remove some of the effects of non-response bias;
 - inclusion of interview data from partially-responding households;
 - analysis of tours data, in addition to current analysis by trip and stage;
 - early availability of web-based interface for customers to run their own tables;
 - core/rotating questionnaire design, including some suggested new topics.
19. Other requirements could not be met. These are listed below.
 - The inclusion of non-household residents (except students – see above), such as temporary visitors in hotels, or residents of other communal establishments. It was not considered practicable to include these, because no sampling frame exists, and it is likely that responses would be poor.
 - The recording of short walks in diaries for more than one day. We consider that the current practice provides ample data for analysis, and a further increase would place an unnecessary burden on respondents.

Timetable for further work

20. Some aspects of development work need to be in place ready for a dress rehearsal in the autumn of 2001. Other developments will be taken forward and tested over a longer period, for implementation when the final 2002 data-base is constructed in spring 2003.

Future arrangements for consultation

21. A small Steering Group will be set up, to allow consultation during 2001 on the various new aspects of the 2002 survey that have not yet been finalised.
22. This group will be chaired by the head of the TSPT division, and will include two internal and two external representatives (Professor Peter Jones and one other).
23. The group will continue to meet once a year in the autumn, to agree plans for the coming year.

Table 9.1 Timetable for further work

Area of work/dates	Tasks
IMPUTATION Jan 2001 onwards	Documentation of existing procedures. Review of current practice, with decisions on change, possibly to include more than is currently done, such as imputing for missing diary data in partially-responding households. Implementation of new procedures.
WEIGHTING Dec 2000 onwards	Preliminary work to gauge likely effects and direction. Development of calibration weighting system using existing data. Possible use of data from non-response survey (see below). Setting up production of final weighted data.
NON-RESPONSE Spring 2001	Development of non-response survey, based on suggestions from tenderers, with possible academic input. Testing on pre-pilot and/or dress rehearsal. Feed into weighting work.
PARTIAL RESPONSES Summer 2001	Planning of exactly how data will be combined, and what will be available/used when. Setting up database according to scheme.
QUESTIONS Spring/ summer 2001	Further consultation with users. Decide on core questions, and rotation scheme. Prioritise remaining/new questions for time of data availability. Testing on pre-pilot and/or dress rehearsal.
STRATIFICATION Spring 2001	Decisions for 2002-2003, when sample size is known. Work on 2001 Census data, to consider further changes for 2004.
STUDENTS IN HALLS OF RESIDENCE Spring 2001	Test proposed collection method using existing survey. Implement in time for 2002.
TOURS Spring 2001	Development of tours database.
WEB-BASED DATA ACCESS Spring 2001	Make available web interface for data.

ASK IF: Difbus = Yes
 AND: BusOut = No
 AND: BusPrb95 = Health

Busdf25 INTERVIEWER: HAS
 INFORMANT MENTIONED SOME
 OTHER DIFFICULTY ABOUT
 USING BUSES?
 IF 'YES' IF POSSIBLE, RECODE
 TO ONE OF THE PREVIOUS
 QUESTIONS
 OTHERWISE SPECIFY WHAT
 THESE ARE IN A NOTE

(1) Yes (SPECIFY)
 (2) No

ASK IF: Difbus = Yes
 AND: BusOut = No
 AND: BusPrb95 = Health

BusImp Is it impossible for you to use the bus
 or could you manage it but with
 difficulty?

(1) Impossible
 (2) Difficult

ASK IF: Difbus = Yes
 AND: BusOut = No
 AND: BusPrb95 = Health
 AND: BusImp = Diffic

ManageB If you were to use the bus would you
 need someone to help you or could
 you manage on your own?

(1) Needs help
 (2) Could manage

ASK IF: IndQn = Face OR Proxy

IntroC I would now like to ask you about
 different methods of transport you
 currently use. You may have told me
 some of this already but I just need to
 check.

PRESS 1 TO CONTINUE

1..1

ASK IF: IndQn = Face OR Proxy

OrdBus How frequently do you use an
 ordinary bus?
 PLEASE COUNT EACH SINGLE
 TRIP AS ONE JOURNEY AND
 EACH RETURN TRIP AS TWO

(1) 3 or more times a week
 (2) Once or twice a week
 (3) Less than that but more than
 twice a month
 (4) Once or twice a month
 (5) Less than that but more than
 twice a year
 (6) Once or twice a year
 (7) Less than that or never

ASK IF: IndQn = Face OR Proxy

Coach How frequently do you use an
 express bus or coach within Great
 Britain?
 PLEASE COUNT EACH SINGLE
 TRIP AS ONE JOURNEY AND
 EACH RETURN TRIP AS TWO

(1) 3 or more times a week
 (2) Once or twice a week
 (3) Less than that but more than
 twice a month
 (4) Once or twice a month
 (5) Less than that but more than
 twice a year
 (6) Once or twice a year
 (7) Less than that or never

ASK IF: IndQn = Face OR Proxy

Train How frequently do you use a
 privatised (formerly BR) train?
 PLEASE COUNT EACH SINGLE
 TRIP AS ONE JOURNEY AND
 EACH RETURN TRIP AS TWO

(1) 3 or more times a week
 (2) Once or twice a week
 (3) Less than that but more than
 twice a month
 (4) Once or twice a month
 (5) Less than that but more than
 twice a year
 (6) Once or twice a year
 (7) Less than that or never

ASK IF: IndQn = Face OR Proxy

TaxiCab

How frequently do you use a taxi/
minicab?
PLEASE COUNT EACH SINGLE
TRIP AS ONE JOURNEY AND
EACH RETURN TRIP AS TWO

- (1) 3 or more times a week
- (2) Once or twice a week
- (3) Less than that but more than twice a month
- (4) Once or twice a month
- (5) Less than that but more than twice a year
- (6) Once or twice a year
- (7) Less than that or never

ASK IF: IndQn = Face OR Proxy

Plane

How frequently do you use an air
flight within Great Britain?
PLEASE COUNT EACH SINGLE
TRIP AS ONE JOURNEY AND
EACH RETURN TRIP AS TWO

- (1) 3 or more times a week
- (2) Once or twice a week
- (3) Less than that but more than twice a month
- (4) Once or twice a month
- (5) Less than that but more than twice a year
- (6) Once or twice a year

ASK IF: IndQn = Face OR Proxy

GenCycle

The next few questions are about
cycling. Excluding exercise bikes, do
you . . .

- (1) own a bicycle yourself,
- (2) have use of a bicycle owned
by someone else in the
household,
- (3) have use of a bicycle owned
by someone outside the
household,
- (4) have no use of a bicycle?

ASK IF: IndQn = Face OR Proxy

Cycle12

May I just check, have you ridden a
bicycle during the last 12 months
[year]?

- (1) Yes
- (2) No
- (3) Don't know/can't remember

ASK IF: IndQn = Face OR Proxy and Cycle12 = Yes

CycRoute

Which one of the following
statements best describes the type of
route you usually took when you
cycled in the last 12 months. Did you
usually cycle . . .

- (1) mainly on the road,
- (2) mainly on the pavements,
cycle paths or cycle lanes that
were not part of the road,
- (3) mainly off the road in parks,
open country, or private land
- (4) on a variety of different
surfaces?

ASK IF: IndQn = Face OR Proxy

Dlfull

Do you hold a full driving licence
valid in Great Britain either to drive a
car or to drive a motorcycle, scooter
or moped?

INCLUDE: DISQUALIFIED
DRIVERS AND INTERNATIONAL
PERMITS/OTHER LICENCES
VALID IN THE UK.

LONG DISTANCE TRAVEL RECORD

Between today's date (/ /) and the date on which you begin your travel diary (/ /), you may wish to keep a note of any journeys you make of 50 miles or longer. Our interviewer will be asking a few more questions on these long distance journeys when he/she returns to collect your travel diary.

Journey No.1

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.2

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.3

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.4

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Journey No.5

Date/...../.....
 Where the journey began
 Purpose to (eg to work)
 Purpose from (eg from home)
 Where the journey ended
 Actual distance travelled
 Main method of travel
 If main method car, motorcycle, van, lorry or other private vehicle were you driver or passenger ?

Travel record of

Travel week

Start day

Finish day

Include walks on the first six days if they are a mile or more

Include all walks on the final day

Enter every journey you do on any other method of transport (bus, train, car, bicycle etc.)

The interviewer

will call again on

Day

Date

Time

442

Purpose of journey (A)

We are interested in a simple description such as 'to work', 'to get home', 'from work to food shopping', 'take a child to school' etc. If you are unsure, make a note and the interviewer will sort it out.

Time left and time arrived (B and C)

Write in hours and minutes. For example 9:15.

From and to (D and E)

Write down the name of the place where your journey started and finished. We are interested in the actual name of the village or town. (You need only record 'H' or 'W' if the journey started or finished at Home 'H' or Work 'W'.)

Method of travel (F)

Show each different method on a separate line, eg car, train, bus. On the first 6 days include walk as a method if it is a mile or more (20 minutes or more). On the final day include **every** walk you do.

Distance (G)

Write in miles and part miles. For example 1.5

Number in party (H)

This means the number of people who set out together. To be included in your party a person must be with you for at least half the distance.

How to fill in your travel record

	A Purpose of journey	B Time left	C Time arrived	D From village/town	E To village/town	F Method of travel	G Distance miles	H Number in party
1	Food Shopping	9:00 am	9:30 am	H	Bristol	1 Walk	1.5	1
2	Return home	10:30 am	11:00 am	Bristol	H	1 Bus	2	1
3	Go To friends	1:00 pm	3:30 pm	H	Hammer-smith	1 Car	2	1
4	Return Home	4:15 pm	11:45 pm	Hammer-smith	H	2 Train	1 1/4	1
5						3 Tube	3.5	1

						1		
						2		
						3		
						1		
						2		
						3		

Public transport				If car or motorbike			
I Time travelling mins	J Cost	No. of boardings	Leave blank	Which car / motorbike used	K Dr / Pass DR, FP or RP	L Drivers only: where parked and cost	M Notes
30							
20	90p	2				£ : p	
18				Renault	DR	Public Car	
76	£14	1				Park	
30	£1.50	1				£ 3 : 00 p	
40	£1.50	1					
40	£14	1				On the Street	
15				Renault	DR	£ 0 : 00 p	
						£ : p	
						£ : p	
						£ : p	
						£ : p	

Time travelling (I)

Give time spent travelling on a bus/train, in a car or walking. Please do NOT include time spent waiting for buses/trains.

Cost (J)

Write the amount paid for the actual journey - so for a journey made with a season ticket write nil. A journey made with a pass may be free or you pay something. If so, write down the cost.

Driver/passenger (K)

For journeys by car or motorbike please record whether you were:

the driver DR
front passenger FP
or rear passenger RP

Drivers only: where parked and cost (L)

We would like to know here if the car/motorbike was parked:

- 'on the street'
- 'on own/friend's property'
- 'in a park-and-ride car park'
- 'in another public car park'
- 'in firm's car park'
- 'in a private car park'
- or 'not parked.'

Please write whether the parking cost was Free (F) / Permit (P) / Season ticket (S) OR write the cost of parking in '£ : p' if it was a one-off payment

Notes (M)

Use this column to note down anything you want to tell the interviewer. For example if you have used a bus-pass, season ticket etc.

To help you in recording, here are examples of fuel gauges in two popular models of cars:

Please record the actual level shown. Since some gauges stick on 'full', if your gauge shows 'full' you will be asked if you think the vehicle had done at least 20 miles since fuel was last put in the tank.

And since some gauges show 'empty' when there is still quite a lot of fuel in the tank, if your gauge shows 'empty' you will be asked if you think the vehicle could have done at least another 20 miles before the tank ran dry.

Day 7

How far?	Any other information, e.g. details of tickets and costs (excluding petrol)

Is the survey confidential?

Yes. The Office for National Statistics (ONS) and the main users of the data, the Statistics Division of the Department for the Environment, Transport and the Regions (DETR), are bound by the same code of confidentiality. No information which could identify you or your household will be passed on to other parts of DETR, other government organisations, local authorities, commercial organisations or to the press.

The National Statistics logo shows that the statistics meet recognised standards of reliability and quality.

What is the Office for National Statistics?

ONS is the government Department which was formed in April 1996 by the merger of the Office of Population Censuses and Surveys with the Central Statistical Office. It gathers together and publishes a range of statistics about the society in which we live and the economy.

The Social Survey Division of ONS carries out many important government surveys throughout Great Britain, providing information on the cost of living, health, housing, and many other matters of public interest.

If you wish to contact us for more information about this survey please write to:

National Travel Survey, 01/15, Office for National Statistics
1 Drummond Gate, London SW1V 2QQ

Or telephone: 020 7533 5474

Further information on National Statistics can be viewed on our website at
<http://www.statistics.gov.uk>

Information on travel and transport statistics can be viewed on the DETR website at
<http://www.detr.gov.uk/tsindex.htm>, or telephone 020 7344 3067 for enquires related to travel statistics.

National Travel Survey

A survey carried out by the Social Survey Division of the Office for National Statistics on behalf of the Department for the Environment, Transport and the Regions (DETR).

national
STATISTICS

What is the survey about?

The government makes many decisions about travel and transport services and to do this it needs up-to-date and reliable information. The best way to do this is to ask people themselves about their travel and the National Travel Survey has been doing this since 1965.

The questions which you and several thousand other households answer each year, give important information on different kinds of transport people use, distances travelled, where people travel to and why they travel.

Why have we come to you?

The households selected have been chosen by taking a representative national sample of addresses from the Post Office's own list. We then approach the people who live at those addresses. To make sure that travelling done by all households is represented, it is important that everyone selected helps us by giving the necessary information.

To obtain a true picture we need to include people who make a lot of journeys, few journeys or no journeys, and people from all age groups.

How is the information used?

The National Travel Survey is used to build up details of different kinds of traveller such as car users or bus users, and to examine travel among particular groups of people in the community such as working people, schoolchildren, the elderly or the disabled.

The survey also helps to find out the transport needs of people in getting to the shops, to the doctor, and for social purposes such as visiting friends and relatives.

Because the survey is carried out during every week of the year, seasonal changes in travel behaviour can be measured. It is the only source of national information on subjects such as cycling and walking.

How can you help us?

The information detailed overleaf was produced with the assistance of people just like **you**, based on their travelling experiences. Now is your chance for your travel needs to be recognised. We rely on your voluntary co-operation and all information given to us is strictly confidential. The information collected from you will be used to help produce statistics on travelling in Britain and will help with future transport and environment plans and policies.

How we get to the shops

Did you know...

- Nowadays, people travel nearly four times as far as they did in 1950.
- Men in their early 60s make a quarter of their trips on foot, compared to a third of trips for those in their late 60s.
- People over 60 use buses more often than children or those of working age. About half have a senior citizens bus pass.
- The average journey to work takes 23 minutes, but for those working in Central London the average is 48 minutes – twice as long.
- The average distance walked per person has fallen from about 250 miles a year to under 200 miles a year over the last 20 years.
- 4 out of 5 men and 3 out of 5 women now hold a full driving licence, compared with 3 in 5 men and 1 in 5 women in 1972.

These are just some of the facts collected by the National Travel Survey over the last few years with the help of the public.

Official statistics bearing the National Statistics logo are
produced to high professional standards set out in the National
Statistics Code of Practice. They undergo regular quality
assurance reviews to ensure that they meet customer needs.
They are produced free from any political interference.

About the Office for National Statistics

The Office for National Statistics (ONS) is the government
agency responsible for compiling, analysing and disseminating
many of the United Kingdom's economic, social and
demographic statistics, including the retail prices index, trade
figures and labour market data, as well as the periodic census
of the population and health statistics. The Director of ONS is
also the National Statistician and the Registrar General for
England and Wales, and the agency administers the statutory
registration of births, marriages and deaths there.

Acknowledgements

Thanks are due to the headquarters staff and interviewers in Social Survey Division of ONS whose consistent hard work has led to the success of the survey. Thanks, of course, are also due to the staff at the Department for Transport (formerly the Department for Transport, Local Government and the Regions) for their advice, guidance and support.

Chapter 1 Introduction

1.1 Background

The National Travel Survey (NTS) provides regular, up-to-date data on personal travel and monitors changes in travel behaviour over time. The first NTS was commissioned by the Ministry of Transport in 1965/66. Further periodic surveys were carried out in 1972/73, 1975/76, 1978/79 and 1985/86. In 1988 the NTS became a continuous survey with field work being carried out every month of the year.

Social Survey Division (SSD) of the Office for National Statistics (ONS) carried out the NTS in 1972/73 and 1985/86 and has been the contractor for the continuous NTS since its launch in 1988. SSD is responsible for questionnaire design, sample selection, data collection, data editing and data file production. Analysis and report production are carried out by the Department for Transport (DfT) (formerly DTLR), the commissioning department for the survey. An edited database is sent to DfT every 3 months and is produced 2 months after the end of fieldwork.

This report describes the methodology of the 2001 NTS. It is intended as a working reference manual and describes the sample design, fieldwork methodology, data production and data file production.

1.2 Uses of the NTS

The NTS provides detailed information on different types of travel; where people travel from and to (at county level), distance, time, purpose and what kinds of people are doing the travelling and how often. The NTS is the only source of national information on subjects such as cycling and walking which provide a context for the results of more local studies.

The results of the survey are published by DfT and are available to users both within and outside Government. Travel research institutes such as the Transport Research Laboratory (TRL) view the NTS as one of their major data sources and the NTS datasets are deposited at the Data Archive at the University of Essex. Details on the use of the NTS are presented in Figure 1.1.

1.3 Sequence of work on the NTS

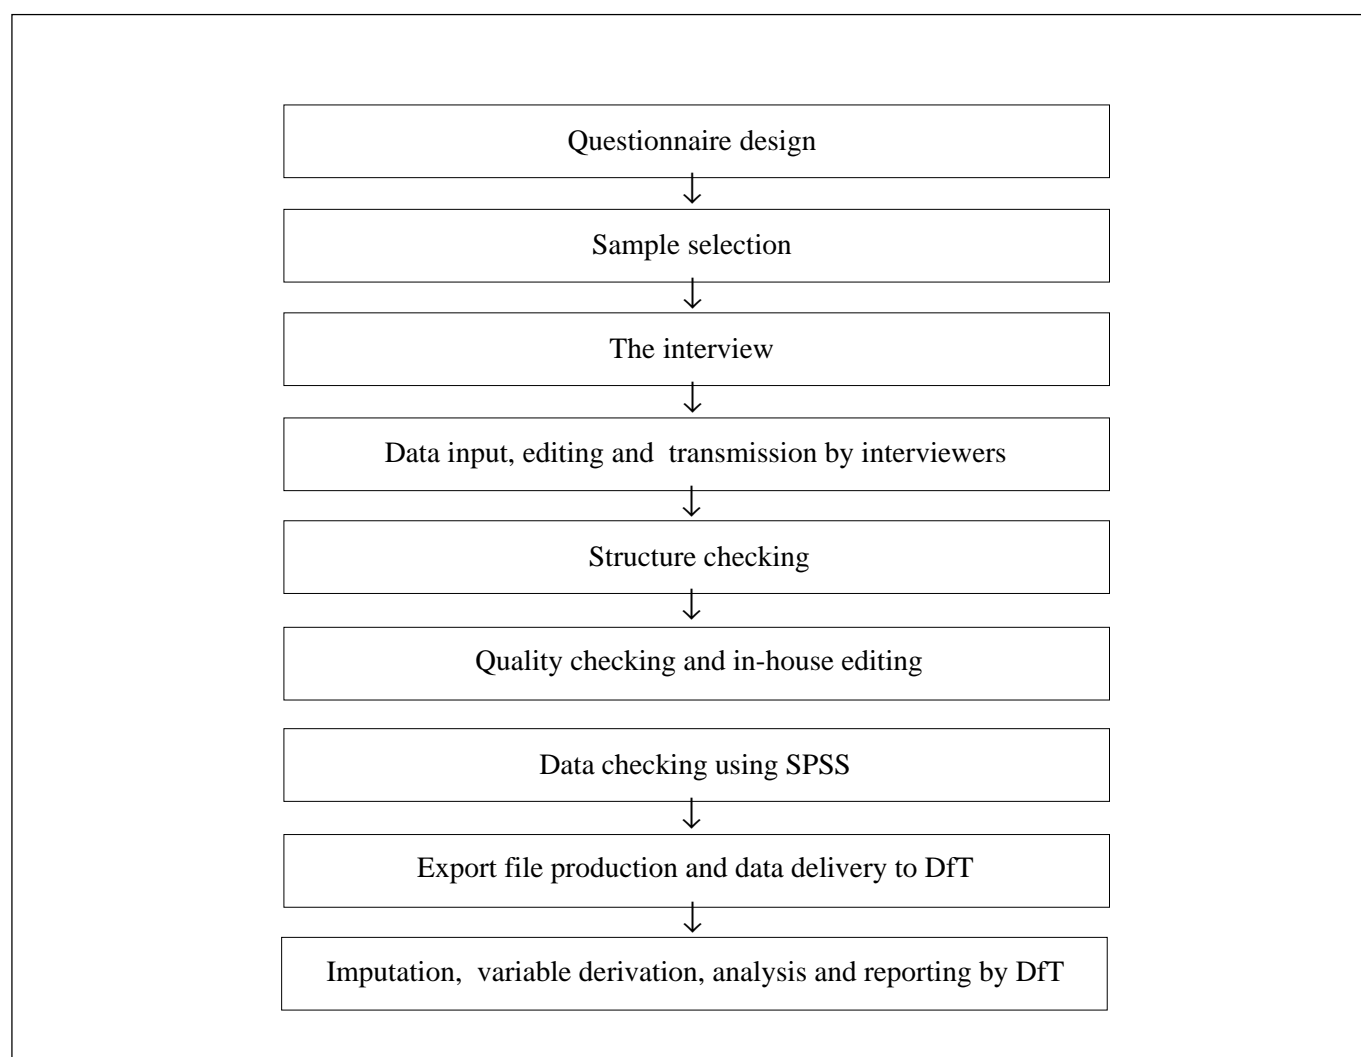

The NTS collects data using two methods: face-to-face interviewing carried out using computer assisted personal interviewing (CAPI) and seven day travel diary keeping. The sequence of tasks carried out on the 2001 NTS is summarised in this section and in Figure 1.2. Details on individual procedures are set out in the remainder of the report.

Figure 1.1 Uses of the NTS

The DfT has used the NTS to:

- build up a general picture of changes in personal travel over time, for all modes including walking, cycling, car and public transport;
- examine travel among special groups in the population such as children, the elderly or disabled;
- estimate accident rates on the basis of exposure to accident risk for different groups in the population;
- establish the level of take up of concessionary fares among those entitled to such fare schemes such as the elderly;
- estimate annual mileage for cars (as opposed to other light vehicles such as taxis or vans); this information is used when road tax and fuel tax payments are under consideration;
- estimate the effect that a change in this balance of road tax to fuel tax would have on different kinds of households;
- examine changes over time in travel for different purposes, such as commuting, business, education, shopping and leisure;
- collect information about whether people use petrol or diesel in their vehicles;
- assess the extent to which tax concessions available to those with company cars encouraged extra mileage;
- examine the relationship between the level of car ownership and the level of bus patronage at regional level; and
- examine car ownership levels and the availability of bus services in rural areas.

Figure 1.2 Sequence of work

1.3.1 Sample selection

The NTS is based on a random **sample** of private households. The 2001 sample size was 5,796 addresses drawn from the **Postcode Address File**. The addresses selected were allocated into interviewer quotas in such a way that each quarter's sample was nationally representative (See Section 2.2.3).

1.3.2 The interview

In advance of the interviewer's first call, letters were sent to the sampled addresses. These letters introduced the survey and explained that an interviewer would call shortly.

The NTS sampled allocation month ran from mid-month to mid-month. The interviewer would usually start to make contact with the household at the beginning of the calendar month in which the seven day diaries (travel records) would be kept. A **placement**

call would be set up prior to the start of the record keeping week (**travel week**) specified for that household. At the placement call, the interviewer would conduct an interview. After the interview, the interviewer explained the travel record keeping procedure in detail.

The placement call was generally followed by a **reminder call**, just before the start of the travel week, to remind the household to begin their travel records, and by a **midweek checking call** during the travel week to check that the records were being completed correctly.

The interviewer made a **pick-up call** to collect the travel records and to check the information recorded with the informants. A few additional questions were also asked. The pick-up call was made within six days of the end of the travel week. Figure 1.3 summarises the calls made to a household.

Figure 1.3 The interview

1.3.3 Data input and editing during the field work period

Working at home, the interviewer transferred and coded the travel information from the **travel records** to the **computerised Journey Input System**. Any inconsistencies identified at this stage were corrected by the interviewer and, if necessary, checked with the informant.

The interviewer then ran the **journey checking program** (pre-specified consistency and plausibility checks) and made the appropriate amendments, again checking back with informants where necessary or referring to the interviewer instructions.

Throughout the field period SSD staff monitored the progress of interviewers' work and answered coding and technical queries.

On a weekly basis interviewers transmitted data to ONS office. Any paper documents were returned by post at the end of the field period. The final transmission and posting date was the 28th day of the month in which field work was completed.

1.3.4 Final data editing and checking and data file production

The transmitted data were structure checked to make sure that all the data transmitted by the interviewers had been received. All returned paper documents were also checked.

Some final coding and checking was then carried out in the office. Manual recodes and interviewers' notes were scrutinised. Quality checks were also made on selected interviewers on a rota basis.

The data were organised into seven record types and sent to DfT on a quarterly basis. The seven record types consisted of: households, individuals, vehicles, long distance journeys made before start of the seven-day Travel Week (two records), journeys made during the Travel Week and stages of the journeys made during the Travel Week.

1.4 Response

Only households classed as 'fully co-operating' were included in the response calculations.¹ In 2001 a national response rate of 65% was achieved.² Under the current contract, the DfT measures response according to Achieved Sample Rates (ASRs). Unlike the usual SSD response measure, ASRs include sampled addresses classified as 'ineligible' in the denominator.³ In 2001 a national ASR of 59% was achieved.²

Notes

1. See 3.7.3 for a description of the term 'fully co-operating'.
2. See Table 3.4. The response data in this report are provisional figures produced from the ONS Field Case Management System. They may differ slightly from the final figures on the analysis database.
3. See Section 2.3.2 for the definition of an ineligible address.

Chapter 2 Sample Selection

2.1 The sample requirements

The survey is required to provide a comprehensive picture of personal travel behaviour by people living in private households in Great Britain. The sample was designed to provide a representative sample of households in Great Britain. The NTS has an annual two-stage set sample of 5,796 addresses with each member of each household providing information about journeys made in a pre-selected seven day period (the travel week). As travel behaviour varies considerably depending on the month of the year or day of the week, interviewing and travel record keeping were spread evenly over the year. Most analysis are carried out on three years data combined, making the total set sample size similar to that of each of the previous periodic surveys. A base of over fifteen thousand provides the degree of precision required by DfT. From 2002 the sample size is being tripled and the majority of results will be available for single years.

2.2 Sample design

2.2.1 The sampling frame

The NTS is based on a random sample of private households. The sampling process is carried out by the Sampling Implementation Unit (SIU) at ONS. The sample is selected using the 'small user' Postcode Address File (PAF), as a sampling frame. The PAF is constructed by the Post Office as a list of all addresses (delivery points) in the country. The 'small user' Postcode Address File is the file of delivery points which receive fewer than 25 items of mail each day. By using the small user file most large institutions and businesses are excluded from the sample.¹ However, some small businesses receive fewer than 25 items of mail a day and are included in the small user PAF so they may have been sampled. These were recorded as ineligible addresses by the interviewers, although interviewers were asked to call at the sampled address in order to check that no private household could be found at the address.

The version of the small user PAF used for selecting the sample is up-dated twice yearly and is specially adapted for use by ONS. The adaptation involves adding information from the Central Postcode Directory (CPD) held at ONS. Examples of the information added are Local Authority codes, wards, grid refer-

ences and data from the census. A match is also made with the National Health Service Users Postcode Directory (NHSUPD), also held at ONS, in order to add Health Authority codes. Addresses previously sampled for the NTS or for any other ONS social survey cannot be sampled for a period of three years.

2.2.2 Sampling procedures

In order to select the appropriate number of addresses, a stratified multi-stage random probability sample was used. There were two stages in the sample selection – the sampling of primary sampling units (PSUs) followed by the sampling of addresses within the selected PSUs. The PSUs were in the form of individual or groups of postcode sectors which contained an average of about 2,900 delivery points. Postal sectors south of the Caledonian Canal with less than 500 delivery points were grouped with contiguous sectors so that the minimum size of a group was 500 delivery points. The minimum size of a group of sectors north of the Caledonian Canal was 250.

Postal sectors covering Scottish Islands and the Isles of Scilly were excluded, as in other major Government surveys (see Table 2.1). The effect of this was to exclude 2.2% of the delivery points in Scotland, and about 0.2% of delivery points in the whole of Great Britain.

The sample is drawn biannually. 252 PSUs were selected in total in 2001, 21 per month; 23 addresses were drawn from each selected PSU.

A way of increasing the precision of a random sample is to stratify it. Before any selection takes place, the population is divided into a number of strata; then a random sample is selected independently within each strata. This ensures that different strata in the population eg regions, are correctly represented. This will also lead to a reduction in standard error.

The 2001 NTS sample was stratified using a regional variable and two PSU-level variables derived from the 1991 Census. The regional variable divides Great Britain into 20 regions. Wales forms one region, Scotland is split into two regions (Strathclyde and the remainder of Scotland), and there are 17 regions based on the nine Government Office Regions of England. In England, inner and outer London, and the former

Table 2.1 Areas omitted from the sample

Region	ONS code and Local Authority name	Name of areas excluded
Southwest	15UH Isles of Scilly	Isles of Scilly
Scotland	71UE Lochaber 78UH Cunninghame 71UH Skye/Lochalsh 78UP Argyll/Bute	Mallaig, Inverie, Soay, Eigg, Muck, Rhum, Canna. Arran, Great/Little Cumbrae Whole authority Bute, Oban/neighbouring islands, Gigha, Islay, Colonsay, Mull(pt)
Jura/	80UB Orkney 81UB Shetland 82UB Western Isles	Whole authority Whole authority Whole authority

Metropolitan Counties are separately identified within the nine Government Office Regions. (Table 2.2).

Within each of the 18 regions the PSUs were ranked in order of the proportions of households with no car and then split into three bands. Within each band the PSUs were ranked in alternate descending/ascending order by the proportion of heads of households in socio-economic groups 1 to 5 and 13 (that is a professional employer or manager). The PSUs were then sampled using a form of systematic sampling to produce a stratified sample.

The number of postcode sectors sampled was fixed in London, but elsewhere it was proportional to the size (number of delivery points) of the region and was obtained by means of the following formula:

$$\frac{\text{No. of delivery points in the region} \times 206}{\text{No. of delivery points in GB outside London}}$$

The aim was to give each household outside London an equal chance of selection. In London, the number of PSU selections was fixed at 18 in Inner London and 21 in Outer London. This 'over-sampling' in London

Table 2.2 The relationship of NTS Regions to Government Office Regions (GOR)

NTS Regional codes	Government Office Region	GOR codes	Number of PSUs
0	Exclusions (Scottish islands)	0	
1	North East Met	1	5
2	North East Non Met	1	6
3	North West Met	2	11

20	Scotland excluding Strathclyde	12	13

Excludes Scottish Islands. Includes mainland North of Caledonian Canal.

was carried out in order to provide sufficient numbers for DfT's particular analysis interest in the area, as response rates in London are lower than elsewhere.

In Great Britain as a whole around 24 million delivery points were available for possible selection with just under three million delivery points in the Greater London area. This means that nationally there was a one in 4,210 chance of an address being selected in the year; in Inner London a one in 3,411 chance of selection, and in Outer London a one in 4,102 chance.

If there is more than one household or business receiving mail at an address an adjustment will need to be made. The Post Office attaches an indicator (the Multi Occupancy Indicator or MOI) to show this. The MOI is intended to indicate the number of 'letter boxes' at the address. A shop with a flat above may have an MOI of two. In general, an MOI of three or more indicates a multi-household address. However, methodological work conducted within SSD has shown that this is only reliable in Scotland.² So in Scotland, addresses with an MOI of three or more were given a chance of selection equal to the MOI. In England and Wales the standard SSD multi-household procedures were used at addresses found to contain more than one household in order to ensure that all households were given an equal chance of selection.³ These procedures were carried out by interviewers at the fieldwork stage. All SSD interviewers are carefully trained in the use of these procedures the details of which are described in Section 2.3.

2.2.3 The allocation of PSUs to interviewer quotas

To reduce unnecessary travelling between addresses by the interviewers, all the addresses selected in a PSU were allocated as a single quota of work for an interviewer. In order to obtain a nationally representative sample for each quarter of the year the PSUs were allocated to quota months such that:

- a total of 21 selections were assigned to a month;
- the correct number of PSU selections were made in each major stratum over the year; and
- the number of PSUs selected per major stratum was as equal as possible from month to month.

A listing of the PSUs allocated to each of the twelve quota months can be found in Appendix C.

2.3 Field sampling procedures

2.3.1 Multi-household procedures

Section 2.2.2. mentioned that the 2001 NTS used the standard SSD multiple-household procedure to ensure that all households at multi-household addresses had an equal chance of selection. These procedures were the:

- pre-sampled multi-household procedure; and
- concealed multi-household procedure.

These procedures are described in full in the NTS Interviewer Instructions. The key points are summarised below.

The pre-sampled multi-household procedure

The pre-sampled multi-household procedure was used at addresses in Scotland with a Multi Occupancy Indicator (MOI) of more than two. Interviewers were instructed to use a selection grid which will select 1 in n households (n being the value of the MOI). Occasionally a pre-sampled multi-household address contained fewer households than the value of the MOI. In such cases, no household would be selected; the selection grid would indicate to the interviewer that no interview was to be completed at the address and the interviewer would return the address as 'directed not to sample any household at the address'.

The concealed multi-household procedure

The concealed multi-household procedure was used where interviewers came across multi-household addresses in England and Wales, and also at addresses in Scotland with an MOI of one. At these addresses interviewers were instructed to include all households up to a maximum of three. At addresses with more than three households interviewers used concealed multi-household selection grids to select three from the number present.

To limit the extent to which an interviewer's quota could be inflated by the occurrence of several concealed and/or pre-sampled multi-households, interviewers were instructed to interview at no more than four extra households from concealed and/or pre-sampled multi-household addresses. This approach may have introduced a very slight bias against households in concealed multi-household addresses but the effect of this is likely to be negligible.³

2.3.2 Ineligible addresses

Three types of addresses were classified as ineligible for the NTS:

- Non-residential addresses and institutions (i.e. residential addresses that did not contain a private household). An institution was defined as: ‘an address at which four or more unrelated people slept; while they may not have eaten communally, the establishment must have been run by a person (or persons) employed for this purpose, or by the owner’. Private households with separate accommodation within an institution were included in the survey.
- Residential accommodation not used by a household as their main address (eg a holiday home or second home). This group was excluded to avoid double counting - households occupying these accommodation had already had a chance of selection at their permanent address.

- Addresses in the PAF that did not exist because they had been demolished, not yet been built, or perhaps two converted flats had been recombined into one house.

2.4 PSU level variables

Fourteen of the survey variables were measured at PSU level (P level). A value on a P-level variable applies to all households living within that PSU. The P-level is therefore the highest level at which the data of the continuous survey may be analysed, coming just above the H (Household) level in the analysis hierarchy. Unlike almost all other variables in the survey, the PSU variables were not derived from information provided by members of the sampled households. Details on the derivation of the variables are given in Table 2.3. A detailed description of the PSU-level variables is given in the 2000 NTS Technical Report.⁴

Table 2.3 Description of the P-level variables

Variable	Description
P1	The Area Number – identification number for the PSU laid down in the sample design.
P2	Describes the category of planning region (Scotland, Wales and the eight Government Office Regions of England).
P3–P4	Left blank for the use by DfT.
P5	Type of area (urban/rural area classification) – P5 was constructed from a classification of urban areas derived by ONS and DfT from the 1991 Census of Population.
P6	PSU population density derived from population density figures supplied by ONS.
P7	Local authority (district) population density derived from population density figures supplied by ONS.
P8–P14	This information was obtained by DfT from a questionnaire sent to all local authorities in Great Britain in 1995/96.*
P8	Availability of concessionary bus fares schemes for pensioners.
P9	Eligibility for concessionary bus fares schemes for pensioners.
P10	Type of concessionary bus fares schemes for pensioners.
P11	Membership fee for concessionary bus fares schemes for pensioners.
P12	Times available for concessionary bus fares schemes for pensioners.
P13	Geographical area covered by the concessionary bus fares schemes for pensioners.
P14	Additional modes of public transport covered by the concessionary fares scheme for pensioners.

* Concessionary fare schemes in Great Britain in 1995/96, DETR (1997).

Notes

1. The characteristics of the PAF as a sampling frame are described in the paper 'An evaluation of the PAF as a sampling frame and its use within OPCS' Wilson P and Elliot D, *The Journal of the Royal Statistical Society Series A* (1987).
2. 'Multi-household procedures for social survey', Barton J, *Survey Methodology Bulletin No. 40* (1997) ONS.
3. 'Office and field procedures for dealing with multi-household addresses', Dodd T, *Survey Methodology Bulletin No. 5* (1979) ONS.

Chapter 3 Field Work procedures and response

3.1 Introduction

The 2001 NTS was a continuous survey with interviewing occurring every month of the year. In addition to the interview, all respondents were asked to keep a record of their travel over seven consecutive days. The travel recording period for each month (the quota month) ran from mid-month to mid-month (Table 3.1). Field work for each quota month of the survey started at the beginning of the month when interviewers contacted households to complete the interview and 'place' the travel records and was completed at the end of the following month when all the travel records had been collected and transferred by the interviewer to the computerised Journey Input System.

Since October 1994 the NTS interview has been conducted using Computer Assisted Personal Interviewing (CAPI). Blaise 4, a software system developed by Statistics Netherlands was used to write the 2001 questionnaire. On NTS, the household, individual and vehicle sections as well as the administration details were incorporated into a single Blaise data model. The Journey Input System was written in the database language 'Clipper' which was also used for data handling purposes by SSD. Both systems cross-referenced one another.¹

3.2 Questionnaire discs and despatch of documents to interviewers

Each month the sampled address lists and paper documents, such as the travel records, were despatched to the relevant interviewers from ONS. Computerised details of the addresses to be interviewed were created and then transmitted to the interviewers via a system of direct communication using modems and dedicated telephone lines. Floppy discs containing the CAPI questionnaire were compiled and posted from ONS.

Technical queries from interviewers regarding the transmission of data were dealt with by a special unit set up to deal with such matters. Laptop maintenance was handled by a separate support unit.

3.3 Public Relations

It was important that informants had complete confidence in the survey and in the interviewer. In advance of the interviewer's call, SSD wrote to each sampled address to inform them of the visit and interview content. A special leaflet designed to explain the importance of the survey to informants, and to encourage more people to take part in the survey, was also included with the advance letter.

Table 3.1 2001 quota month end dates

Month	From		To	
January*	11	January	9	February
February	10	February	11	March
March	12	March	11	April
April	12	April	11	May
May	12	May	10	June
June	11	June	11	July
July	12	July	10	August
August	11	August	11	September
September	12	September	11	October
October	12	October	11	November
November	12	November	11	December
December	12	December	11	January

* The survey year ran from mid-January 2001 to mid-January 2002.

As with all other ONS surveys, the advance letter informed households at the selected addresses that the survey was not compulsory and relied on voluntary co-operation. Informants were also told that any information they gave would be treated in the strictest confidence.

Interviewers were notified of any refusal made to ONS headquarters as a result of the advance letter. These 'headquarters refusals' were included in the overall refusal rate but did not count against the interviewer on the individual interviewer response scores.

Before going into the field all ONS interviewers were issued with a photo identification card. Informants had the opportunity to call ONS headquarters to establish the validity of any interviewer.

3.4 Administering the placement pattern

The principle for assigning Travel Weeks was for interviewers to allocate the first address contacted from their quota list to the first date available on their allocation card, the second address to the second date and so on. In other words, as an interviewer progressed through their quota, the number of travel weeks available became less. If an address was ineligible, or the household refused to take part in the survey, their allocated date was not used.

Travel Weeks were spread across four periods, three of which were allocated 5 addresses and one 6 addresses. In exceptional circumstances, such as not being able to contact a household or a household being away but willing to participate, interviewers used a 5th allocation period, this being the first allocation period of the following month. Each address was assigned one date for the start of the travel week which was selected at random by the computer.

3.5 The interview

The NTS interview at each household could be divided into a strict sequence of events:

- the placement call
- the reminder call
- the mid-week checking call
- the pick-up call

The initial interview was carried out at what was termed the 'placement call'. At this call the interviewer explained the purpose of the survey, ideally to the entire household, and gained the co-operation of the entire household. The interviewer

then asked the head of household or partner questions about the household composition, the household's vehicles and some general background information. Questions were then asked of each individual in the household including children and babies (although for children under the age of 11 the interviewer generally talked to the parent as well as the child). Questions were also asked about each household vehicle from the person best able to give that information (usually the main driver). The interviewer introduced and placed the seven-day Travel Record, and where appropriate, a chart to enter fuel and mileage details for each vehicle in the household and for long distance travel. Interviewers took time to explain in detail how to record journeys made during the travel week and talked the informants through some examples, explaining what to include and what not to include and described the survey definitions,² for example, usual place of work, in course of work etc. Pocket size diaries were occasionally handed out to help informants record details of their journeys. In addition, an NTS pen was left for each household member to aid the completion of the fuel and mileage chart and an NTS fridge magnet was left with each household (for public relations purposes).

When there was a gap of more than a day or two between the placing call and the start of the travel week, the interviewer made a reminder call, either by telephone, post or in person to the household. Interviewers were encouraged to make the call in person where they were concerned about a particular household's commitment to diary keeping.

Sometimes the interviewer would make an additional mid-week checking call on a household part way through the travel week to help with problems and encourage accurate record keeping. This call was made at the interviewer's discretion when she/he judged that informants needed encouragement or assistance with record keeping. Again, interviewers were encouraged to call in person.

Pick-up calls were made within six days of the end of record keeping. Interviewers were instructed to target households where they were uncertain of the informant's ability to maintain accurate records and make those pick-up calls within one or two days of the end of record keeping. The interviewer collected the travel record of each household member and checked the contents with the informant. The interviewer also asked some additional questions about any vehicles acquired since the placement interview, whether a provisional or full driving licence or season ticket had been acquired and also about any long distance journeys made between placement and the start of the travel week. These questions were also asked using a

Blaise CAPI questionnaire. Fuel and mileage charts were also collected and information about vehicle mileage and fuel gauge details were entered into the CAPI questionnaire either during the pick-up interview or later, by the interviewer at home.

3.6 The 2001 NTS questionnaire

3.6.1 Questionnaire structure

The structure of the 2001 questionnaire is set out in Figure 3.1. A maximum of 10 people, 10 vehicles and 40 long distance journeys per person could be included in any one household interview. When an interviewer encountered a household larger than this a second household was opened and the data stored separately to be merged after structure checking, back at the office.

The NTS continuous dataset is usually analysed in three year periods (1989/91, 1992/94, 1995/97, 1998/2000), so it has been convenient to introduce new variables at the start of each new three year period, in 1992, 1995, and 1998. Consequently there were a number changes to the questionnaire in 2001.

The text of the 2001 questionnaire is set out in Appendix A. The key differences between the 2001 and 2000 questionnaires are set out below.

Individual level questions:

- Addition of an ethnic group question.
- Questions about the reliability and frequency of local services such as buses and trains.
- Questions about the use of vehicles for making deliveries.
- Questions about the use of vehicles for travel outside of Great Britain.

In April 1998 the final Unitary Authorities (UA) were introduced in England. The National Travel Survey now codes Unitary Authorities and type of area (classification of urban areas) as well as counties in England, Scotland and Wales on three different parts of the questionnaire: origin and destination codes for long distance journeys; place of work; and origin and destination on the diary journeys. Coding of county UA, and area type for these questions is done using a frame consisting of approximately 4500 place names. Places not contained within a new UA were coded with the county only for both fields.

3.6.2 Harmonised Questions

Harmonised questions were introduced to the NTS to allow users to compare NTS data with those from the other government social surveys³. These replaced similar questions previously used in the NTS. A number of harmonised questions are used in the 2001 NTS and are detailed in Figure 3.2.

3.7 Post interview coding and checking

After collecting the information and material from households at the pick up call, interviewers transferred the data from the travel records into the computerised Journey Input System, coded the occupation, industry and socio-economic group of each informant aged 16 and over and the interview outcome for each household.

3.7.1 Transferring the data from the travel records

At the interviewer's home the data from the travel records were transferred to the Journey Input System written in the database language Clipper. This was basically a straightforward data entry operation where the information was simply copied across onto the interviewer's laptop computer. The system was designed to match the travel records layout exactly. Any inconsistencies identified at this stage were corrected by the interviewer, if necessary checking with the informant. The interviewer then ran the journey checking program comprising pre-specified consistency and plausibility checks and made appropriate amendments, again checking back with informants where necessary or referring to coding instructions.

3.7.2 Socio-economic classification

The occupation of informants aged 16 or over and who had ever worked were coded using the Standard Occupational Classification (SOC2000). From 2001 the National Statistics Socio-economic Classification (NS-SEC) has been used for all official surveys, replacing Social Class based on occupation. The NS-SEC is an occupation-based classification and is created using the unit groups of SOC2000 and details of employment status. Industry information was coded using the Standard Industry Codes (SIC) (1992). Details of the classifications are set out in Tables 3.2A and 3.2B.

3.7.3 Coding the outcome for each household

Households eligible for interview were divided into 3 categories for outcome coding purposes: fully co-operating households, partially co-operating households and non-responding households.

A household was coded as ‘fully co-operating’ if there was complete journey information for each individual in the household and the bulk of the rest of the information was present. The majority of all of the following sections should have been completed:

- the household section;
- an individual section for each person listed in the household box;
- a vehicle section for each vehicle listed in the vehicle grid; and
- all journeys for each person entered into the journey input system and checked fully.

A ‘partially co-operating’ household must have had at least a household questionnaire completed. A household would be included as ‘partially co-operating’ if any journeys were missing.

An eligible household was said to be ‘non-responding’ if the household had refused to take part in the survey or the household was away for the whole of the interviewing period and the interviewer was unable to make contact.

Interviewers also had to assign an outcome code (Table 3.3) to the households they had classified as ineligible using the criteria set out in Section 2.3.2. The code the interviewer would assign to an ineligible household was dependent on the reason for its ineligibility.

3.7.4 Interviewer query service

In the past one person would have closely supervised the office editing process thereby minimising coding and editing bias. Under CAPI interviewers carried out

Figure 3.1 The structure of the questionnaire

Section	Subject
Household	Household box. Placement and Travel Week dates. Background questions. Availability of public transport. Access to amenities Number of household vehicles. Vehicle Grid.
Individual	Who interviewed and in what order. Disability section. Frequency of use of various methods of transport Driving licences and type of vehicle driven. Employment, Occupation and Industry details, Income. Place of work and travel to work. Season ticket details. Any long distance journeys made. Long distance journey information. Recall question.
Vehicle	Introduction. Registration details. Parking. Vehicle subsidies. Mileage. Pick-up questions from fuel and mileage chart.
Admin. block	Calls and contact information. Occupation, Industry and Outcome coding. Reasons for refusal.
Journey input and editing system	Journey data input and error checking program.

the editing procedure. In order to reduce variability and possible bias among interviewers a service was provided whereby interviewers could report queries relating to survey definitions or coding. The queries were handled by the NTS field co-ordinator who could obtain an overview of all interviewers' work.

Any queries not covered by the instructions were referred to the research officer and displayed on the NTS electronic bulletin board. If necessary, the research officer would contact DfT. The query service therefore ensured that central control was maintained over editing decisions.

3.8 Response

Tables 3.4, 3.5 and 3.6 show the national response rate for the period mid-January 2001 to mid-January 2002 and the London response rate for the same period.

During 2001 the NTS maintained a response rate nationally of 65%. The response rate achieved in the Inner and Outer London areas were 46% and 58% respectively. The DTLR measured response according to Achieved Sample Rates (ASRs) which included sampled addresses classified as 'ineligible' in the denominator. Achieved sample rate calculations are also shown in the Table 3.4 to 3.6.

Refusal to co-operate	133	27	30
Non-contact	18	4	4

Note: Percentage figures may add up to 99% or 101% because of rounding.

Notes

1. A detailed description of the conversion to Computer Assisted Personal Interviewing and the development of the journey input and editing system is given in Chapter 3 of the 1994 NTS Technical Report.
2. All the NTS definitions are set out in the NTS Definitions Manual (copies available on request).
3. Government Statistical Service (1996), *Harmonised Concepts and Questions for Government Social Surveys*, and Government Statistical Service (1998) *Harmonised Concepts and Questions for Government Social Surveys – update December 1997*, Office for National Statistics: London.

Chapter 4 Data Processing

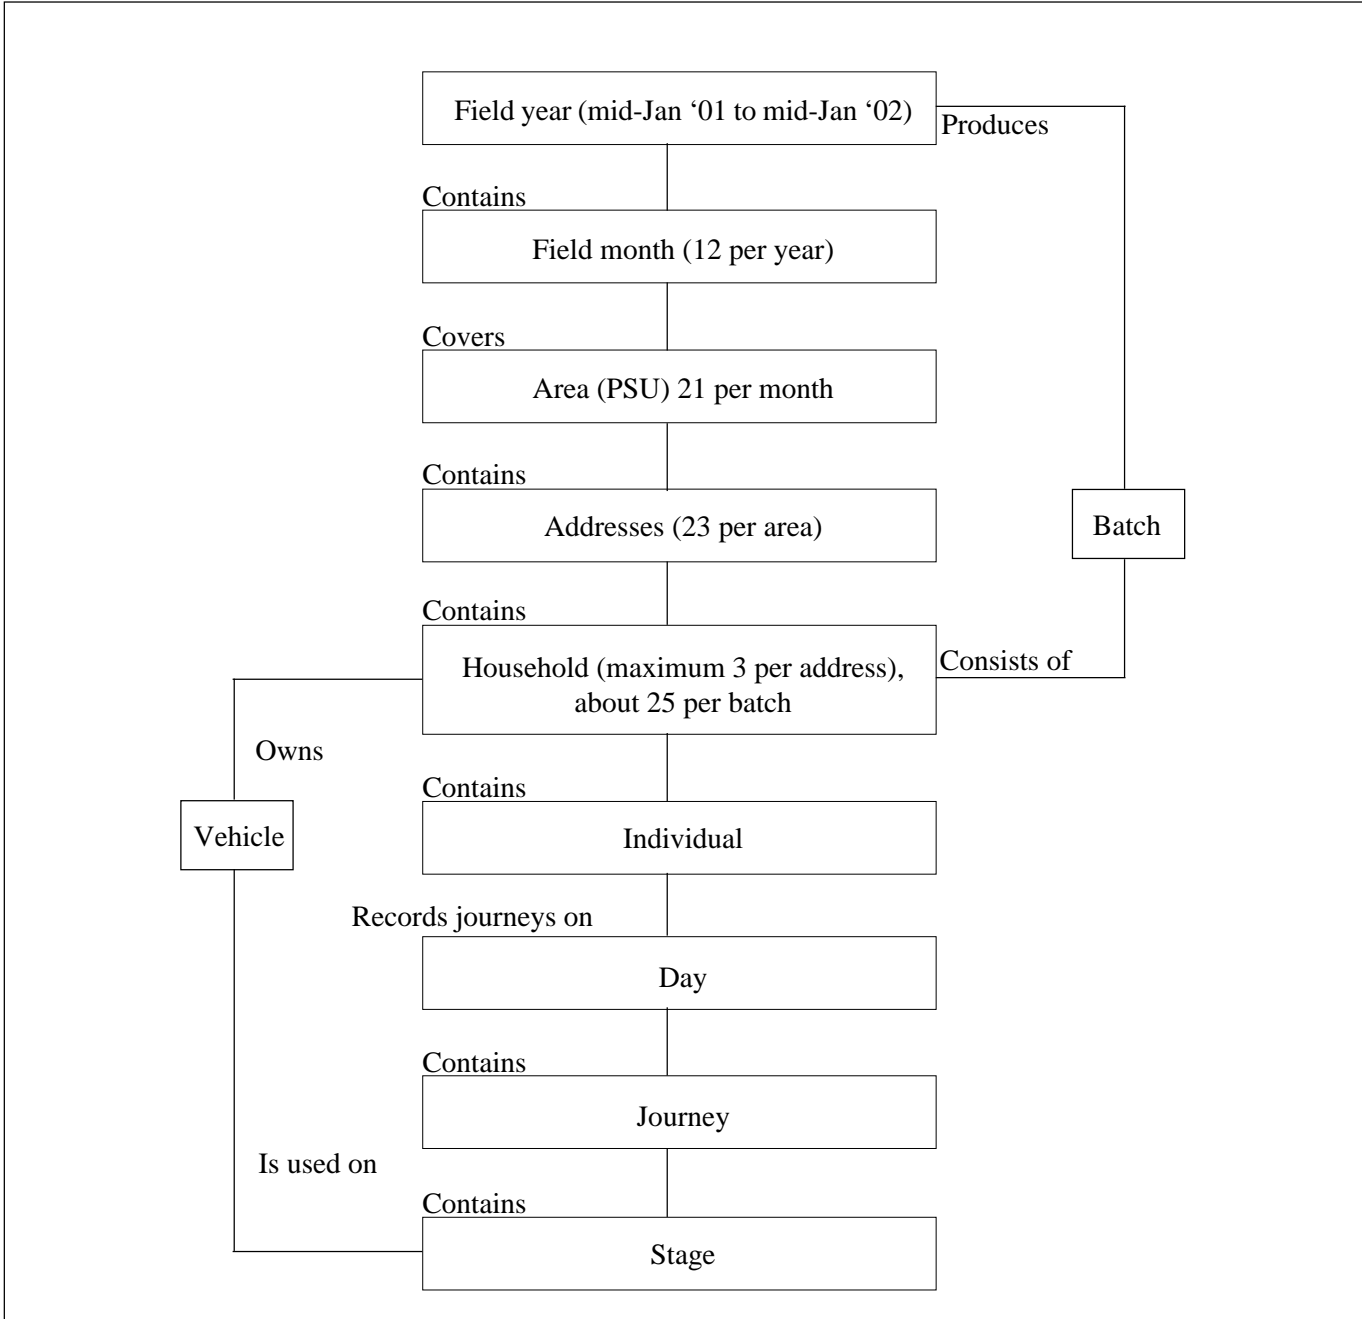

4.1 Data transmission and despatch of paper documents from interviewers

On a weekly basis interviewers transmitted data to ONS. To ensure security, the data were encoded before transmission. Any paper documents were posted to ONS at the end of the field period. The final transmission and posting date was the 28th of the month in which field work was completed.

4.2 Downloading and structure checking

In order to download data transmitted by interviewers into a single dataset, a program was run which unzipped, aggregated and added interview data together. A procedure for checking the data was then implemented. This procedure checked for blank, deleted and duplicated records and reported errors. It also carried out structure checking of the data to make sure that journey information had been coded in accordance with the household outcome coding. Data structure details are set out in Figure 4.1.

Figure 4.1 Data structure

4.3 Data editing

Following the move to CAPI, almost all of the old paper editing system was incorporated into the CAPI program and carried out by interviewers. Some follow-up work was, however, conducted after ONS had received the transmitted data using a separate Blaise program. A brief description of the in-house coding and editing procedure is given below. Further details of the checks and coding carried out by the editing staff are given in the NTS headquarters editing instructions.

4.3.1 Interviewer's notes and suppressed checks

At any time during the interview interviewers were able to open a note using the Blaise note book facility. All interviewer notes created in this way were printed on the NTS fact sheet accompanying each household. Most notes contained an explanation of why an interviewer had suppressed a particular error message and may not have required any action from the HQ editor. However, sometimes interviewers may have been unsure about how to code a question, for example, the type of season ticket or area travel card used, and would record the name of the ticket and further details in the Blaise notebook. The editors were then able to check the interviewer's coding or recode if necessary.

4.3.2 Coding

i) Re-coding

Wherever the interviewer had recorded an 'other specify' answer the editor would be required to either re-code to one of the pre-specified answers or leave in the 'other specify' category. A decision would be made based on information recorded by the interviewer in the Blaise note book or in a separate text variable.

ii) Make and model coding

Where a particular vehicle make and model was 'not listed' in the make and model coding frame editors were required to allocate a code back in the office.

iii) Fuel tank size coding

The fuel tank size for most vehicles was automatically coded using the vehicle's make and model information. Editors were only required to enter the exact size of the vehicle's fuel tank for vehicles not listed in the make and model coding frame or if the informant had been unable to provide the information.

iv) County, unitary authority and area type coding

Where interviewers had been unable to allocate a code for county, unitary authority or area type, for usual place of work or journey origin and destination, editors were required to allocate the correct code.

4.4 Data conversion

The data was organised into seven record types according to the requirements of DfT (Table 4.1): households, individuals, vehicles, whether made long distance journeys, long distance journeys details, journeys and stages. Missing values were interpreted as 'no answers' (-8) and 'does not apply' (-9). Final checks were made by ONS research staff at the aggregate level using SPSS to ensure the accuracy of the data. The files were then converted to ASCII format and sent to DfT by e-mail.

Table 4.1 Record types

Record type	Data	Level
Record 1	Households	Household
Record 2	Individuals	Individual
Record 3	Vehicles	Vehicle
Record 4	Whether made long distance journeys	Individual
Record 5	Long distance journeys (LDJ) made before the Travel Week	LDJ
Record 6	Journeys made during the Travel Week	Journey
Record 7	Stages of journeys made during the Travel Week	Stage

Chapter 5 Analysis Variables in the 1999/2001 NTS Database

5.1 Introduction

This chapter contains a summary description of the variables on the 1999/2001 NTS database - part of the continuous survey dataset which dates back to July 1988. General advice on the structure of NTS variables is given in Section 2 of the Technical Guide to the 1985/86 NTS.¹ Changes between 1985/86 and 1999/2001 have been minor (see 3.6 and Technical Report 2000² Chapter 6) and the Technical Guide for 1985/86 is, in most part, still valid.

The key points about the structure of the NTS database are summarised below:

- The data are held on computer as a set of data records, each providing information for the subject of the record type, such as a household, a person or a vehicle.
- There are about 200 main variables and these are held at one of eight levels: area, household, vehicle, individual, long-distance trip, day, trip and stage. Data from different levels can normally be linked together, though matching trip stages to household vehicles used in the stages can be difficult. Household vehicles are linked to main drivers, i.e. the individuals that drive the most mileage in the vehicle over a year.
- Some variables, called numerical variables, are unbanded. They include such data as age and stage distance. They may be used within tables to give estimates, eg of travel distance by mode of travel. They may also be used to create other banded or unbanded variables by recoding or by aggregation. Each numeric variable has an associated banded variable, (normally with a variable number 1 greater than the unbanded one) which holds the information in grouped form, eg j33 bands trip times in 14 categories from 'Less than 3 minutes' to '6 hours and over', whilst j32 is the numeric variable running from 1 minute upwards.
- There is no multi-coding on any main variable. Some variables, eg on suggestions for improving bus services or special tickets/passes, are spread over more than one variable for those giving two or more suggestions.
- Missing data are normally imputed, or patched, on the NTS, using procedures that were described in some detail within Section 4 of the 1985/86 Technical Guide.¹ Where patching is done by reference to the nearest record, this implies that region of residence and possibly type of area are also necessarily used in the imputation process. Thus, most 'Not available' (NA) categories for variables are shown as having a nil frequency. In unbanded variables, missing data generate zero values and so must be excluded from counts of the variable.
- Filters can be used in the specification of tables to restrict analyses to key records, eg those aged under 16.
- The only re-weighting routinely carried out for analyses is that for short walk trips and short walk stages. This is because the information was only collected on the last day of the travel diary week and so the data must be re-weighted by a factor of 7. Re-weighting for known biases in the achieved sample are not currently carried out, as the biases have only a small effect on most variables. However, weighting is likely to be introduced for data from 2002, following the NTS Quality Review – see *Technical Report 2000*,² Chapter 9.

5.2 List of main variables

Data from most variables are also available for earlier years of the continuous database. First available dates are noted below where applicable. Where questions were asked for the first time in 2001, availability of data will be very limited until 2002 data are available. Detailed descriptions for each variable (except those new in 2001) can be found in the *Technical Report 2000*,² Chapter 5.

Primary sampling unit (psu) variables

Area geography

P2	Government Office Region
P5	Type of area
P6	PSU population density
P7	LA (district) population density
P15	County of residence (from 1992)

Concessionary fares schemes

P8	OAP bus scheme
P9	Eligibility for scheme
P10	Type of concession
P11	Membership fee
P12	Times available
P13	Areas available
P14	Modes additional to bus

Household variables

Address

H12	Address type
H51	Length of residence

Access to public transport

H13	Walk time to bus stop
H14	Frequency of bus service
H15	Walk time to railway station
H16	Bus time to railway station
H17	Type of railway station
H106	Main type of bus service (from 1993)

Transport ratings (from 2001)

H122/123	Frequency/reliability of local buses
H124/125	Frequency/reliability of local trains/Underground/Metro
H126	Condition of pavements locally
H127	Condition of cycle lanes/paths locally

Access to services (from 1998)

H18/19	Walk/bus distance to Doctor
H20/21	Walk/bus distance to nearest Post Office
H22/23	Walk/bus distance to nearest Chemist
H24/25	Walk/bus distance to nearest Food Store
H26/27	Walk/bus distance to nearest Shopping Centre
H28/29	Walk/bus distance to nearest General Hospital

Household composition

H58	Number of people in household
H74	Number of adults
H75	Number of children
H59	Household structure (family)
H60	Household structure
H61	Household structure (NTS)
H62	Disabled (16+) in household

Social and economic

H50	Type of tenancy
H65	HoH/HRP economic status
H66	HoH/HRP employment status
H67	SEG of HoH/HRP
H68	HoH/HRP age/sex
H69	HoH/HRP industry
H70	Household income
H72	Origin of household income
H84i	Real h/hold income equivalent semi-decile (1998/2000)
H85i	Real h/hold income equivalent quintile (1998/2000)
H83	Employed in household
H108	ACORN classification (from 1996)
H121	Index of deprivation (from 1998)

Travel difficulties (from 2001)

H128	Any journey difficulties
H129	Difficulties in travelling to and from work
H130	Difficulties in travelling to and from town centre shops
H131	Difficulties in travelling to and from visiting friends

Vehicle access

H35	Number of bicycles
H52	Number of household cars
H53	Number of h/hold motorcycles
H54	Number of h/hold vans/lorries
H55	Number of h/hold cars/light vans
H57	H/hold vehicle availability
H63	Persons with full car licence
H107	Number of household company cars

Period of travel

H7	Travel week end date (month)
H92	Calendar year

Attitudes to local bus services (from 1993)

H100	Local bus service satisfaction
H101	Encouraged to use local buses
H102	1st or only improvement mentioned
H103	2nd improvement mentioned
H104	3rd improvement mentioned
H105	4th improvement mentioned

Vehicle variables

Vehicle characteristics

V3	Type of vehicle
V15	Taxation class
V85	Vehicle registration
V86/87	Engine capacity
V88	Type of fuel
V130	Make and model (from 1992)
V154	Gender of main driver

Age

V89	Registration letter
V90	Year of first registration
V131	Month of first registration (from 1992)
V91	Vehicle age

Usage

V45/46	Estimate of annual mileage
V92	Rank of car in household
V93/94	Vehicle's total mileage
V95/96	Mileage in travel week
V97/98	Eligible mileage
V121	Ineligible mileage
V139/140	Annual vehicle commuting mileage
V141/142	Annual vehicle business mileage
V143/144	Annual vehicle other mileage

Fuel consumption

V99/100	Fuel purchased (litres)
V101/102	Fuel cost (pounds)
V134/135	Fuel consumed (litres) (from 1992)

Benefits and support for motoring costs

V103	Purchase/hire costs
V112	Company car summary
V133	Person no. company vehicle assigned to (from 1992)

Parking (from 1995)

V145	Overnight parking location
V146	Distance of parking from house
V147	Type of parking payment
V148/149	Annual parking fee

Individual variables

Personal characteristics

I2	Relationship to HoH/HRP
I3	Sex
I4	Legal marital status
I5/6	Age
I164	Age/sex
I269	Living arrangements

Social and economic

I177	Economic status (from 1998)
I79	Industry type
I178	Annual income
I274	Standard Occupational Classification (SOC2000) (from 2001)
I275	Ethnic group (from 2001)

Travel difficulties

I165	Travel difficulties
I166	Difficulty going out on foot
I167	Walking aids
I168	Difficulty using a bus
I169	Bus difficulty – getting to stop
I170	Bus difficulty – waiting at stop
I171	Bus difficulty – getting on/off
I172	Bus difficulty – to/from seat
I174	Bus difficulty – other/ unspecified
I212	Disabled driver (from 1995)
I214	Years since last drove (from 1995)

Access to motor vehicles

I182	Driving licence
I183	Driving experience
I203	Access to car

Frequency of use of transport (from 1998)

I261	Frequency of bus use
I262	Frequency of express bus/coach use
I263	Frequency of surface rail use
I264	Frequency of taxi/minicab use
I265	Frequency of bicycle use
I266	Frequency of use of air flights within GB

Special tickets and passes

I185	1st ticket/pass type
I186	1st ticket/pass mode priority
I187	1st ticket/pass validity
I188/189	1st ticket/pass use
I205	1st ticket/pass cost

Travel to work

I92	Work place
I220	County of work (from 1992)
I267	Unitary of work (from 1999)
I180	Usual means of travel to work
I251	Type of workplace (from 1998)

Long-distance trip variables (from 1992)

Purpose

L7	Trip purpose to
L13	Trip purpose from
L12	Trip purpose

Travel distance and main mode

L9/10	Trip length
L8	Main mode of transport

Origin and destination

L5	Trip origin (county)
L6	Trip destination (county)

Travel period

L3	Travel month
L11	Travel week

Day variable

D1	Travel day
----	------------

Trip variables

Structure

J14	Series of calls
J23	No. of stages (inc. short walks)
J37	Short walk trip

Purpose

J24	Trip purpose from
J26	Trip purpose to
J28	Trip purpose

Travel times

J29/30	Overall travelling time
J32/33	Overall trip time (minutes)
J31/54	Trip start time
J55/56	Trip mid-point time
J59/60	Trip finish time
J52	Day of week

Travel mode and distance

J34	Trip length (inc. short walk)
J36	Main mode of transport

Travel speed

J40	Overall speed
J41	Mean travel speed

Origin and destination (from 1992)

J57	Trip origin (county)
J58	Trip destination (county)

Stage variables

Mode

S2	Mode of transport
S24	Mode of travel
S28	Short walk
S41	Main stage

Travel time, distance and speed

S25/26	Length of stage
S27	Stage speed
S36/37	Travel time (minutes)

Occupancy

S7–8	Number in party
------	-----------------

Public transport

S15/S38	Number of boardings
S29/30	Ticket cost (1)
S31/32	Ticket cost (2)
S33/34	Total cost (pence)
S35	Type of ticket

Private transport

S18	Private vehicle occupant
S19	Where parked
S21	Parking cost
S22	Whose vehicle?

2. Ashley Kershaw *et al* (2001) *National Travel Survey Technical Report*, 2000, Office for National Statistics: London.

Chapter 6 Additional information available from NTS Technical Report 2000

Every three years a more detailed Technical Report is produced. The last one was the Technical Report 2000.¹ This contains the following additional information.

Chapter 5

Information for each variable, where appropriate, on source, derivation, definitions, imputation, unbanded variables.

Chapter 6

Definitions compared with earlier surveys (to 2000).

Chapter 7

Comparison of 1998/2000 NTS data with other sources and with previous surveys.

Chapter 8

Sampling errors for 1998/2000.

Chapter 9

The main report to the National Statistician on the NTS Quality Review.

ASK ALWAYS:

Qnames

ASK ALWAYS:

WhoHere

Who normally lives at this address?

(1) PRESS ENTER TO CONTINUE

ASK ALWAYS:

Name

RECORD THE NAME (OR A UNIQUE IDENTIFIER) FOR HOH, THEN A NAME/IDENTIFIER FOR EACH MEMBER OF THE HOUSEHOLD HELP<F9>

WHEN ALL HOUSEHOLD MEMBERS HAVE BEEN ENTERED, PRESS PgDn

STRING[12]

ASK ALWAYS:

Sex**

- (1) Male
- (2) Female

ASK ALWAYS:

Birth**

What is your date of birth? FOR DAY NOT GIVEN ENTER 15. FOR MONTH NOT GIVEN ENTER 6.

ASK ALWAYS:

Age if**

What was your age last birthday? 98 or more = CODE 97 (HELP<F9>) 0..97

ASK IF: AGE >=16

MarStat**

Are you/is name married, living together as a couple, single, widowed, divorced or separated?

- (1) Single/never married
- (2) married
- (3) Separated
- (4) Divorced
- (5) Widowed

ASK IF: AGE >=16

AND: MarStat <> MarrLiv

LiveWith**

May I just check, are you living with someone in the household as a couple?

- (1) Yes
- (2) No
- (3) SPONTANEOUS ONLY – Same sex couple

ASK ALWAYS:

EthGroup**

INTERVIEWER: SHOW PROMPT CARD A

To which of these ethnic groups do you consider you belong? Please choose from this card . . .

- (1) British
- (2) Another White background
- (3) White and Black Caribbean
- (4) White and Black African
- (5) White and Asian
- (6) Any other mixed background
- (7) Indian
- (8) Pakistani
- (9) Bangladeshi
- (10) Any other Asian background
- (11) Caribbean
- (12) African
- (13) Any other Black background
- (14) Chinese
- (15) Other

ASK IF: EthGroup=OthWhite

OthWht

Please specify other White background

STRING[20]

ASK IF: EthGroup=MixedOth

OthMxd

Please specify other Mixed background

STRING[20]

ASK IF: EthGroup=OthAsn

OthAsn

Please specify other Asian background

STRING[20]

ASK IF: EthGroup=OthBlk

OthBlk

Please specify other Black background

STRING[20]

ASK IF: EthGroup=AnyOth

OthEth

Please specify other ethnic group

STRING[20]

** Double asterisk denotes a harmonised question.

ASK ALWAYS:

RelHoh** INTERVIEWER: Code relationship to HOH

- (1) Head of household
- (2) Spouse/partner/cohabitee
- (3) Child of HoH or spouse
- (4) Parent of HoH or spouse
- (5) Other relative
- (6) Other non-relative

QAccom

ASK ALWAYS:

Accom** Is this household's accommodation:

- (1) a house or bungalow
- (2) a flat or maisonette
- (3) a room/rooms
- (4) or something else?

ASK IF: Accom = Hse:

HseType** Is this house/bungalow:

- (1) detached
- (2) semi-detached
- (3) or terraced/end of terrace?

ASK IF: Accom = Flat

FltTyp** Is this flat/maisonette:

- (1) a purpose-built block
- (2) a converted house/some other kind of building?

ASK IF: Accom = Other

AccOth** Is this accommodation a:

- (1) caravan, mobile home or houseboat
- (2) or some other kind of accommodation?

QTenure

ASK ALWAYS:

Ten1**

In which of these ways do you occupy this accommodation?
SHOW PROMPT CARD B MAKE SURE ANSWER APPLIES TO HoH (^DMNAMES[LDMHoHnum]) (HELP<F9>)

- (1) Own outright
- (2) Buying it with the help of a mortgage or loan
- (3) Pay part rent and part mortgage (shared ownership)
- (4) Rent it
- (5) Live here rent-free (including rent-free in relative's/friend's property; excluding squatting)
- (6) Squatting

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Tied** Does the accommodation go with the job of anyone in the household?

- (1) Yes
- (2) No

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

LLord** Who is your landlord?... (HELP<F9>) CODE FIRST THAT APPLIES

- (1) the local authority/council/New Town Development/ Scottish Homes
- (2) a housing association or co-operative or charitable trust
- (3) employer (organisation) of a household member
- (4) another organisation
- (5) relative/friend (before you lived here) of a household member
- (6) employer (individual) of a household member
- (7) another individual private landlord?

ASK IF: (Ten1 = Rent) OR (Ten1 = Rent free)

Furn** Is the accommodation provided: ... (HELP<F9>)

- (1) furnished
- (2) partly furnished (eg carpets and curtains only)
- (3) or unfurnished?

Appendix A Household Questionnaire

QResLen

ASK ALWAYS:

HLong** RECORDED for HoH (^LDMInt Name) ONLY

How long have you (has ^LDMInt Name) lived at this address? ... (HELP<F9>)

- (1) Less than 12 months
- (2) 12 months but less than 2 years
- (3) 2 years but less than 3 years
- (4) 3 years but less than 5 years
- (5) 5 years but less than 10 years
- (6) 10 years but less than 20 years
- (7) 20 years or more

ASK IF: HLong = less than 12 months

HMnth How many months have you (has ^LDMIntName) lived here?

1..12

ASK IF: HLong = less than 12 months

OldAdd Is your (is ^LDMIntName)'s old address more than one mile from here or less than that?

- (1) More than one mile
- (2) One mile or less

QLocServ

ASK ALWAYS:

SatServ [*]
Now I would like to ask some questions about your local bus services. By local I mean services which operate near your home. How satisfied are you with your local bus services?

SHOW PROMPT CARD A

- (1) Very satisfied
- (2) Fairly satisfied
- (3) Neither satisfied nor dissatisfied
- (4) A little dissatisfied
- (5) Very dissatisfied
- (6) Don't use buses

ASK ALWAYS:

EncRage Would you be encouraged to use local buses more often if improvements were made to the bus services?

- (1) Yes
- (2) No
- (3) Not sure

ASK IF: ((EncRage = Yes) OR (EncRage = NtSure))
OR (EncRage = DONTKNOW)

Improv Which do you think are the main ways in which the services could be improved? Please use this card as a guide and mention up to four.

INTERVIEWER: SHOW PROMPT CARD B.....SEPARATE CODES WITH . OR -

USE <F6> AND PAGE DOWN KEY TO SEE MORE CODES SET [4] OF

- (1) Better provision for the disabled/elderly
- (2) Better provision for people with young children or heavy shopping
- (3) Cheaper fares
- (4) Boarding point closer to home
- (5) Quicker journey time
- (6) More destinations or routes
- (7) More reliable or punctual services
- (8) More frequent services at weekends
- (9) More frequent evening services
- (10) More frequent day-time services
- (11) Better information about services
- (12) Other (SPECIFY IN A NOTE)

ASK ALWAYS:

BusProv Which is the main type of bus provided locally. Is it...

RUNNING PROMPT

- (1) mainly small buses (mini-buses or midi-buses)
- (2) mainly large buses
- (3) OR an equal mixture of both small and large buses?
- (4) No local bus service

ASK IF: (BusProv = MnSmall) OR (BusProv = MnLarge) OR (BusProv = Equal)

NearBus About how long would it take ME to walk from here to the NEAREST bus stop (or place where I could get on a bus)? (I am interested in the NEAREST one even if it isn't the main one you use.)
INTERVIEWER: IF INFORMANT GIVES A RANGE eg. 25-30 MINS THEN CODE LOWEST GROUP ie. 4

0..98

ASK IF: NearBus = DONTKNOW

NearBand INTERVIEWER: SHOW PROMPT CARD C

Could you tell me which of these bands is the approximate time that it would take ME to walk to your nearest bus stop?

INTERVIEWER: IF DK ENCOURAGE ESTIMATE

(1) 6 minutes or less
(2) 7-13 minutes
(3) 14-26 minutes
(4) 27-43 minutes
(5) 44 minutes or longer

ASK IF: (BusProv = MnSmall) OR (BusProv = MnLarge) OR (BusProv = Equal)

GetBus How often would I be able to get a bus from that bus stop during the day?

PROMPT AS NECESSARY IF VARIES' TAKE WEEK DAY OFF-PEAK FREQUENCY

(1) Less than once a day
(2) At least once a day
(3) At least once an hour
(4) At least once every half-hour
(5) At least once every quarter-hour

ASK ALWAYS:

NearSta Now thinking of your local train service, how long would it take ME to walk to your nearest railway (that is, ex-BR) or underground station? Again it is the NEAREST one I am interested in, even if it is not the main one or the one you use.

0..98

ASK IF: NearSta = DONTKNOW

GenCycle

The next few questions are about
cycling. Excluding exercise bikes, do
you . . .

- (1) own a bicycle yourself,
- (2) have use of a bicycle owned by
someone else in the household,
- (3) have use of a bicycle owned by
someone outside the household,
- (4) have no use of a bicycle?

ASK IF: IndQn = Face OR Proxy

Cycle12

May I just check, have you ridden a
bicycle during the last 12 months
[year]?

- (1) Yes
- (2) No
- (3) Don't know/can't remember

ASK IF: IndQn = Face OR Proxy and Cycle12 = Yes

CycRoute

Which one of the following
statements best describes the type of
route you usually took when you
cycled in the last 12 months. Did you
usually cycle . . .

- (1) mainly on the road,
- (2) mainly on the pavements, cycle
paths or cycle lanes that were not
part of the road,
- (3) mainly off the road in parks, open
country, or private land
- (4) on a variety of different surfaces?

ASK IF: IndQn = Face OR Proxy

Dlfull

Do you hold a full driving licence
valid in Great Britain either to drive a
car or to drive a motorcycle, scooter
or moped?

INCLUDE: DISQUALIFIED
DRIVERS AND INTERNATIONAL
PERMITS/OTHER LICENCES
VALID IN THE UK.

- (1) Yes

**National
Travel Survey**

In confidence

Travel record of

Travel week

Start day

Finish day

Include walks on the first six days if they are a mile or more

Include all walks on the final day

Enter every journey you do on any other method of transport (bus, train, car, bicycle etc.)

The interviewer will call again on

Day Date Time

Purpose of journey (A)

We are interested in a simple description such as 'to work', 'to get home', 'from work to food shopping', 'take a child to school' etc. If you are unsure, make a note and the interviewer will sort it out.

Time left and time arrived (B and C)

Write in hours and minutes. For example 9:15

From and to (D and E)

Write down the name of the place where your journey started and finished. We are interested in the actual name of the village or town. (You need only record 'H' or 'W' if the journey started or finished at Home 'H' or Work 'W'.)

Method of travel (F)

Show each different method on a separate line, eg car, train, bus. On the first 6 days include walk as a method if it is a mile or more (20 minutes or more). On the final day include every walk you do.

Distance (G)

Write in miles and part miles. For example 1.5

Number in party (H)

This means the number of people who set out together. To be included in your party a person must be with you for at least half the distance.

How to fill in your travel record

	A Purpose of journey	B Time left	C Time arrived	D From village/town	E To village/town	F Method of travel	G Distance miles	H Number in party

Time travelling (I)

Give time spent travelling on a bus/train, in a car or walking. Please do NOT include time spent waiting for buses/trains.

Cost (J)

Write the amount paid for the actual journey - so for a journey made with a season ticket write nil. A journey made with a pass may be free or you pay something. If so, write down the cost.

Driver/passenger (K)

For journeys by car or motorbike please record whether you were:

the driver **DR**
front passenger **FP**
or rear passenger **RP**

Drivers only: where parked and cost (L)

We would like to know here if the car/motorbike was parked:

- 'on the street'
- 'on own/friend's property'
- 'in a park-and-ride car park'
- 'in another public car park'
- 'in firm's car park'
- 'in a private car park'
- or 'not parked.'

Please write whether the parking cost was Free (F) / Permit (P) / Season ticket (S) **OR** write the cost of parking in '£ : p' if it was a one-off payment

Notes (M)

Use this column to note down anything you want to tell the interviewer. For example if you have used a bus pass, season ticket etc.

To help you in recording, here are examples of fuel gauges in two popular models of cars:

Please record the actual level shown. Since some gauges stick on 'full', if your gauge shows 'full' you will be asked if you think the vehicle had done at least 20 miles since fuel was last put in the tank.

And since some gauges show 'empty' when there is still quite a lot of fuel in the tank, if your gauge shows 'empty' you will be asked if you think the vehicle could have done at least another 20 miles before the tank ran dry.

Is the survey confidential?

Yes. The Office for National Statistics (ONS) and the main users of the data, the Statistics Division of the Department for the Environment, Transport and the Regions (DETR), are bound by the same code of confidentiality. No information which could identify you or your household will be passed on to other parts of DETR, other government organisations, local authorities, commercial organisations or to the press.

The National Statistics logo shows that the statistics meet recognised standards of reliability and quality.

What is the Office for National Statistics?

ONS is the government Department which was formed in April 1996 by the merger of the Office of Population Censuses and Surveys with the Central Statistical Office. It gathers together and publishes a range of statistics about the society in which we live and the economy.

The Social Survey Division of ONS carries out many important government surveys throughout Great Britain, providing information on the cost of living, health, housing, and many other matters of public interest.

If you wish to contact us for more information about this survey please write to:

National Travel Survey, 01/15, Office for National Statistics
1 Drummond Gate, London SW1V 2QQ

Or telephone: 020 7533 5474

Further information on National Statistics can be viewed on our website at
<http://www.statistics.gov.uk>

Information on travel and transport statistics can be viewed on the DETR website at
<http://www.detr.gov.uk/tisindex.htm>, or telephone 020 7944 3067 for enquires related to travel statistics.

National Travel Survey

A survey carried out by the Social Survey Division of the
Office for National Statistics on behalf of the Department
for the Environment, Transport and the Regions (DETR).

national
STATISTICS

What is the survey about?

The government makes many decisions about travel and transport services and to do this it needs up-to-date and reliable information. The best way to do this is to ask people themselves about their travel and the National Travel Survey has been doing this since 1965.

The questions which you and several thousand other households answer each year, give important information on different kinds of transport people use, distances travelled, where people travel to and why they travel.

Why have we come to you?

The households selected have been chosen by taking a representative national sample of addresses from the Post Office's own list. We then approach the people who live at those addresses. To make sure that travelling done by all households is represented, it is important that everyone selected helps us by giving the necessary information.

To obtain a true picture we need to include people who make a lot of journeys, few journeys or no journeys, and people from all age groups.

How is the information used?

The National Travel Survey is used to build up details of different kinds of traveller such as car users or bus users, and to examine travel among particular groups of people in the community such as working people, schoolchildren, the elderly or the disabled.

The survey also helps to find out the transport needs of people in getting to the shops, to the doctor, and for social purposes such as visiting friends and relatives.

Because the survey is carried out during every week of the year, seasonal changes in travel behaviour can be measured. It is the only source of national information on subjects such as cycling and walking.

How can you help us?

The information detailed overleaf was produced with the assistance of people just like **you**, based on their travelling experiences. Now is your chance for your travel needs to be recognised. We rely on your voluntary co-operation and all information given to us is strictly confidential. The information collected from you will be used to help produce statistics on travelling in Britain and will help with future transport and environment plans and policies.

How we get to the shops

Did you know...

- Nowadays, people travel nearly four times as far as they did in 1960.
- Men in their early 60s make a quarter of their trips on foot, compared to a third of trips for those in their late 60s.
- People over 60 use buses more often than children or those of working age. About half have a senior citizens bus pass.
- The average journey to work takes 23 minutes, but for those working in Central London the average is 48 minutes – twice as long.
- The average distance walked per person has fallen from about 250 miles a year to under 200 miles a year over the last 20 years.
- 4 out of 5 men and 3 out of 5 women now hold a full driving licence, compared with 3 in 5 men and 1 in 5 women in 1972.

These are just some of the facts collected by the National Travel Survey over the last few years with the help of the public.
